Revision 0
January 2016

Disclaimer

This document is a DRAFT document prepared by the Performing Defendants under a government Consent Decree. This document has not undergone formal review by the EPA and VT DEC. The opinions, findings, and conclusions, expressed are those of the author and not those of the U.S. Environmental Protection Agency and VT DEC.

EXECUTIVE SUMMARY

This document is the Compliance Monitoring Report for monitoring activities performed during summer and fall 2015 at the Pine Street Canal Superfund Site in Burlington, Vermont. The Sand Cap and the Amended Cap are functioning as designed. Wetlands and aquatic biological communities are present and active. Deep groundwater and surface water are unaffected by site-related contamination. The Vertical Barrier is retarding and diverting groundwater flow as designed. The extent and thicknesses of DNAPL generally have not increased between the Canal and the Lake. The thicknesses of DNAPL in passive recovery wells adjacent to the amended cap are similar to previous years. Wells RW-106 and RW-107 on the east side of the Canal contained more than 0.1 foot of DNAPL for the first time in 2014, and did so again at least once in 2015. The fall 2015 data indicate that the maximum contaminant level (MCL) for benzene and arsenic continue to be exceeded beyond the Class IV groundwater area in the area west of the Canal. Additional summaries of the monitoring results are provided below.

GROUNDWATER

Groundwater Level Measurements and Hydrology

The 2015 data indicate groundwater gradients consistent with prior monitoring events.

Groundwater Sampling

In October 2015, seven wells had benzene above the Vermont Groundwater Enforcement Standard (VGES) and MCL of 5 μg/L. Four of these wells are outside the Class IV groundwater area: MW-21A, MW-28A & 28B, and MW-27B (newly installed in 2014). Benzene concentrations in MW-21A stabilized in 2011, and have ranged between 450 and 1,000 μg/L since then. Benzene concentrations in MW-21B were variable throughout 2013 and 2014, but were not reported above laboratory reporting in October 2015. Benzene in MW-22A (located south of the Vertical Barrier and within the Class IV groundwater area) has increased over the last eight monitoring events to its October 2015 concentration of 1,500 μg/L. Its deep companion, MW-22B, first had a detection of benzene in October 2013, and 590 μg/L was reported in October 2015.

The naphthalene concentrations in MW-21A have been variable since 2012, with the highest concentration of 620 μg/L reported in October 2015. Wells MW-27A & 27B also contained naphthalene in fall 2015 (at 8 μg/L and 100 μg/L, respectively). Naphthalene in MW-27A has been decreasing since it was first sampled in 2014, while MW-27B has been variable. These wells are outside of the Class IV groundwater area. Naphthalene was reported in fall 2015 in three wells inside the Class IV boundary above its VGES: in MW-22A at 760 μg/L, in MW-22B at 710 μg/L, and in MW-23B at 3,100 μg/L. Naphthalene does not have an MCL; the VGES for naphthalene is 20 μg/L.

The only metal with an exceedance of its MCL and/or VGES in October 2015 was arsenic (previously present in groundwater). Arsenic concentrations in MW-21B increased consistently in 2013 and 2014, and although concentrations have stabilized, and both sampling events in 2015

were lower than the previous year, this location exhibits a slight overall increase since the initial well installation in 2000. Overall, the lead concentration in MW-20B generally increased between 2001 and 2010, but has stabilized since then. These general increases in lead and arsenic appear to correlate with a general decrease of oxidation-reduction potential suggesting development of a reducing environment, which could cause dissolution of naturally occurring metals in the aquifer.

Overall, concentrations of VOCs and naphthalene appear to have stabilized or slightly decreased in wells sampled between the Vertical Barrier and the lake since the installation of the Barrier in 2013; specifically in MW-21B, MW-27A and MW-27B. The well cluster just to the south of the Barrier, MW-22A & B, has seen increases in analyte concentrations such as benzene and naphthalene since 2013, as have wells up-gradient of the Barrier. This suggests that the Vertical Barrier is diverting and/or retarding water as designed.

NAPL Monitoring – Groundwater Monitoring Wells
NAPL thicknesses in monitoring wells were similar to previous events. Measurable NAPL was present only in wells which have historically contained NAPL (MW-17, MW-23A and MW-23B).

NAPL Monitoring – Vertical Barrier NAPL Recovery Wells
No measurable NAPL was present in the four passive recovery wells in the vicinity of the Vertical Barrier.

NAPL Monitoring/Removal – Amended Cap NAPL Recovery Wells
The DNAPL thicknesses measured in the Amended Cap passive recovery wells in 2015 were similar to those previously observed. In 2014, RW-106 and RW-107 contained more than 0.1 ft. of DNAPL for the first time, and this was seen sporadically again in 2015. RW-106 had 0.3 ft. of DNAPL in June 2015, and RW-107 had 0.5 ft. and 0.4 ft. DNAPL in June and October, respectively.

SURFACE WATER

No PAHs were detected above practical quantitation levels during the September 2015 surface water monitoring event.

CAP MONITORING

No reported metals or PAHs in sediment cores collected from any of the capped areas exceeded the benchmark values. Four of the nine mid-cap samples contained detectable PAHs, although the sum-of-PAH values reported were all less than 0.20 mg/kg, well below the 21 mg/kg benchmark value.

AMENDED CAP MONITORING

Amended Cap Settlement Plate Survey and Bathymetry
The settlement plate survey data does not indicate significant settling, erosion, rebound or gas

build-up which would adversely impact the performance of the Amended Cap. The Amended Cap continues to appear stable and perform as designed.

Visual Sheen Monitoring
No NAPL or sheen release areas were observed emanating through the Amended Cap. No new areas of sheens were observed in 2015. As seen over the past few years, gas bubbles with associated sheens and/or NAPL droplets were recorded in an area 45-102 feet north of Amended Cap footprint, and in an area adjacent to the southeast edge of the Amended Cap.

Cap Termination Inspections
No significant areas of damage were noted during visual examinations of the edges of the Amended Cap.

BIOLOGICAL MONITORING

The fall 2015 monitoring results indicate that the following biological performance standards have been met:

- Presence of a macrobenthic invertebrate community;
- Wetland restoration in the West Bank Cap area;
- Presence of submergent palustrine open water vegetation;
- Hydric soil morphology in Areas 3 and 7

The wetlands restoration planting performed in 2013 in regard to the Amended Cap was successful, with no on-site mortality of the plantings in 2015.

WEIR INSPECTION

No significant settlement of either the weir or the railroad bridge was observed. The concrete of the weir was in good condition, with no cracks, exposed rebar or scaling noted.

SEDIMENT TRANSPORT MONITORING

No storms of sufficient magnitude to trigger the automatic sampling system occurred in 2015.

1.0 INTRODUCTION

This document is the Compliance Monitoring Report (CMR) for monitoring activities performed during summer and fall 2015 at the Pine Street Canal Superfund Site (the Site) in Burlington, Vermont. This report was prepared by The Johnson Company (JCO) on behalf of the Performing Defendants, pursuant to the Consent Decree, Section VI (Performance of the Work and the Projects by Performing Defendants), paragraph 13 (Compliance Monitoring) and the Statement of Work, Section VI.B.3 (Appendix C to the U.S. Environmental Protection Agency (EPA) Record of Decision).

On April 10, 2002, EPA granted approval of the April 3, 2002 Compliance Monitoring Workplan (CMWP), Revision 3. Subsequent to that approval, the need for additional remedial action and monitoring was identified as a result of nonaqueous phase liquid (NAPL) seeps observed in the west bank of the historic barge canal at the Site (Canal) approximately between transects T9+50 and T14+10. The West Bank Cap was installed in 2004 to address those seeps, and NAPL was removed from the Canal cap surface. Additional monitoring in the vicinity of the West Bank Cap was added to Revision 4 of the CMWP, which was submitted electronically to EPA and Vermont Department of Environmental Conservation (VT DEC) on August 3, 2004. Additional construction activity conducted in 2010 included the installation of several NAPL monitoring and recovery wells, dredging portions of the previously installed cap, and installation of a new Amended Cap in the vicinity of transects T9 to T12+50. The monitoring summarized in this report was performed consistent with the procedures presented in CMWP, final revision 5, dated December 27, 2006 (JCO, 2006), and subsequent revisions specific to stormwater in-flow monitoring (sediment traps) as well as the Operation, Maintenance and Monitoring Plan (OMMP) for the Amended Cap which was conditionally approved on October 28, 2011. The schedule and details of monitoring for NAPL in wells adjacent to the Amended Cap and Canal (in the OMMP) were modified pursuant to an August 9, 2013 EPA letter (NAPL monitoring/collection frequency was reduced to monthly, and the trigger for NAPL removal was reduced to 0.1 foot NAPL accumulation up to three times in 48 hours per monthly event).

Construction of a Vertical Barrier was initiated and completed in 2013 to prevent the potential migration of NAPL, and reduce the migration of dissolved contamination, under the railroad tracks to Lake Champlain ("Lake"). Post-construction monitoring of the Vertical Barrier was performed as specified in the October 1, 2012 (Revision 1) Draft Remedial Design Report, Pine Street Canal Vertical Barrier.

In 2013, ecological wetlands restoration was implemented in accordance with the Restoration Plan for Mitigation of Habitat Loss Due to Installation of the Amended Cap (JCO, 2012). In 2015, there were two monitoring events for the restoration area at the Site and one monitoring event for the off-site restoration area at the Ethan Allen Homestead (EAH).

This report discusses the methods, laboratory analyses, quality assurance and quality control (QA/QC) measures, and monitoring results for selected long-term monitoring tasks performed from April through November 2015. As required in the CMWP, field notes and forms generated during sample collection and monitoring are included in this report (Appendix 1). Also included are: a summary of potentiometric data (Appendix 2); a summary of all analytical and field data (Appendix 3); Lake and climate data (Appendix 4); chains-of-custody (Appendix 5); laboratory-supplied and survey data packages (Appendix 6); photographs (Appendix 7); validation reports prepared by an Independent Data Validator (IDV) and QA/QC correspondence and documentation (Appendix 8) and the Wetlands Restoration Monitoring Report (Appendix 9).

2.0 FIELD SAMPLING/MONITORING ACTIVITIES

The compliance monitoring activities that are the subject of this report include the following:

Groundwater Monitoring

- Water level and field parameter monitoring in groundwater monitoring wells
- Sampling and laboratory analysis of groundwater in 18 unconsolidated deposits wells
- Sampling and laboratory analysis of groundwater in three deep unconsolidated deposits or bedrock monitoring wells

NAPL Monitoring and Recovery

- Monitoring wells: NAPL monitoring in 17 groundwater monitoring wells and removal of NAPL from these wells where present and as feasible
- Vertical Barrier Passive Recovery Wells: NAPL monitoring in the four recovery wells located along the railroad tracks in the vicinity of the Vertical Barrier
- Amended Cap Passive Recovery Wells: NAPL monitoring and removal in the 14 recovery wells located along both sides of the Amended Cap

Surface Water Monitoring

- Water quality monitoring
- Visual sheen and NAPL monitoring on the Canal water surface in the vicinity of the Amended Cap

Cap Monitoring

- Cap coring and analysis
- Survey of nine settlement plates on the Amended Cap
- Visual integrity inspection of the Amended Cap terminations

Biological Monitoring

- Benthic macroinvertebrate sampling
- Aquatic vegetation observations

Outlet Weir Inspection

- Visual inspection
- Elevation Survey

Sediment Transport Monitoring

- Automated storm water sampling

The dates of each field activity performed in 2015 are summarized in Table 2-1. Detailed descriptions of the various field activities performed are provided in the following subsections.

TABLE 2-1
COMPLIANCE MONITORING ACTIVITIES – 2015

Location	Description	NAPL Measurement	Sampled for Lab Analysis	Water Level Measurements Completed	Visual Field Evaluations

2.1 GROUNDWATER

2.1.1 Groundwater Level Measurements

Groundwater level measurements were performed according to *Site Specific Method #9 - Water Level Measurements*, and recorded in field log books (Appendix 1). Groundwater level measurements in shallow wells for potentiometric map generation were performed on October 5, 2015 and the data are summarized in Appendix 2, along with historical data from the Vertical Barrier monitoring, Additional Remedial Investigation – ARI (JCO, 1997), Pre-Construction Phase, and Construction/Post Construction phase groundwater monitoring events. Canal stage measurements were made at the railroad equipment bridge, the outlet weir, and at staff gauge SG#8 installed circa transect T9+00 in the Canal, during the 2015 groundwater, cap, and biological monitoring events; those data are also included in Appendix 2. Groundwater level measurements performed at the time of groundwater sampling are included in the data printouts in Appendix 3: Summary of all Analytical Data and Groundwater Field Data.

Lake Champlain stage data for the period of groundwater level measurements were downloaded from the USGS web page for Station 04294500 at ECHO at the Leahy Center for Lake Champlain in Burlington, Vermont; the data are included in Appendix 4. The Lake stage data obtained from USGS are provided in reference to the 1929 National Geodetic Vertical Datum (NGVD29) and were adjusted to conform to the datum used at the Site (including the benchmark used to determine the Canal stage) which is the 1988 North American Vertical Datum (NAVD88). According to the Vermont Department of Transportation (VT DOT, 2001), the adjustment factor between the 1929 and 1988 datum is 0.48 feet (the 1988 datum is lower). Climate data from Burlington Airport were also obtained for the period of groundwater sampling and monitoring as required by the CMWP and are also included in Appendix 4.

An evaluation of these data, including potentiometric maps, is included in Section 4.1.1.

2.1.2 Groundwater Sampling

Groundwater samples were collected October 5-7, 2015 from 21 wells:

MW-9A & B	MW-20A & B
MW-21A & B	MW-22A & B
MW-23B	MW-24A & B
MW-25B	MW-26A & B
MW-27A & B	MW-28A & B
MW-11D	MW-13
MW-18	

The locations of the sampled wells are shown on Figure 2-1.

All samples were collected according to *Site Specific Method #8 - Groundwater Sampling of Monitoring Wells: Water Quality* using dedicated bladder pumps (with the exception of well MW-23B, which was sampled with a peristaltic pump as specified in the CMWP). Installation depths of the pumps are listed on the field sampling forms which are included in Appendix 1 and also in the well purging summary in Appendix 3. Field parameter measurements made during sampling were also recorded on field forms. A summary of the results of the field parameter measurements is provided in Appendix 3. All non-dedicated sampling equipment was decontaminated between wells according to *Site Specific Method #27 – Decontamination of Field Equipment*.

Sampling dates are listed in Table 2-1 and in the summary tables in Appendix 3. No field parameters were measured during sampling of well MW-23B due to the historical presence of NAPL in that well. In accordance with the Quality Assurance Project Plan (QAPP), the appropriate QA/QC samples were delivered with the samples under chain-of-custody (COC) protocol to Lancaster Laboratories, Inc. of Lancaster, Pennsylvania. Copies of the COC forms are included in Appendix 5, and full analytical reports are included in Appendix 6. A discussion of the groundwater analytical results is presented in Section 4.1.2.

2.1.3 NAPL Monitoring – Groundwater Monitoring Wells

The NAPL monitoring portion of the groundwater monitoring program was performed or attempted on October 5-6, 2015, in accordance with Section 4.1.4 of the CMWP Field Sampling Plan (FSP), in the following wells:

MW-1B	MW-3C
MW-4	MW-4B
MW-8A	MW-12
MW-13	MW-17
MW-19	P-102
P-104	P-106
MW-23A	MW-23B

Well MW-19, located on the beach of Lake Champlain, was previously damaged in 2013, and still contains an obstruction circa 47 feet below the top-of-casing which prevented access to the bottom of the well. P-102, P-104 and P-106 also contained obstructions and therefore complete NAPL monitoring was not possible in these wells. MW-8A was not monitored because it could not be located with a metal detector or shovel.

The NAPL monitoring results from these events are presented in Section 4.1.3 and Appendix 3, along with all available historical results. The locations of, and monitoring results for, the monitoring wells tested for the presence of NAPL in October 2015, are shown on Figure 2-2. All recovered NAPL, and associated personal protective equipment (PPE) and disposable sampling equipment were stored on-Site in drums and plastic totes for eventual transport off-site to an approved disposal facility.

2.1.4 NAPL Monitoring/Removal – NAPL Recovery Wells

Monthly NAPL monitoring and removal was performed from April through late November 2014 in the following wells:

RW-101	RW-102
RW-103	RW-104

RW-105	RW-106
RW-107	RW-108
RW-109	RW-110
RW9+80	RW10+25
RW11	RW14

In addition, NAPL monitoring was performed in January, May and October 2015 in wells RW-111, RW-112, RW-113 and RW-114.

OMMP NAPL monitoring and removal in wells adjacent to the Amended Cap was conducted monthly from April through November, 2015. During each event, NAPL thickness and water depth were measured in each of the wells using a steel measuring tape. If DNAPL thickness was observed greater than 0.1 foot (0.3 feet in the large-diameter 18 inch wells: RW9+80, RW10+25, RW11, and RW14) on the first day of each event, it was removed using a suction pump until approximately less than 10% of the fluid extracted contained NAPL based on visual observation. DNAPL was removed if it was present at thicknesses greater than 0.1 feet for three consecutive days during each monitoring event. Results of the NAPL monitoring and removal activities are summarized in Section 4.1.4. The locations of the recovery wells and other monitoring locations are shown on Figures 2-2 and 2-3.

2.2 SURFACE WATER

Monitoring of surface water quality at the Site was conducted at the outlet of the Turning Basin to Lake Champlain to assess the potential transport of contaminants to Lake Champlain during a non-precipitation period. Surface water samples for polycyclic aromatic hydrocarbon (PAH) analysis were collected from the Turning Basin outlet up-stream from the railroad bridge on September 22, 2015 (see Figure 2-4). The FSP anticipated that samples would be collected immediately preceding the cap coring event and after five consecutive days of no measured precipitation greater than two-tenths of an inch (0.2 in.) registered at Burlington Airport. This criterion was met for the 2015 sampling event, with a combined total of 0.13 inches of rain was

recorded (0.11 inch on September 19 and 0.02 inch on September 20; two to three days prior to the surface water sampling event).

The surface water samples were collected as discrete grab samples in accordance with *Site Specific Method #35 For Surface Water Sampling of Non-volatile Constituents.* In accordance with the FSP, the samples were not filtered. All samples were stored in an iced cooler until their delivery to the laboratory under chain-of-custody. The samples were analyzed by Lancaster Laboratories, Inc. for the 17 Pine Street PAHs by EPA Method 8270. The surface water monitoring results are summarized in Appendix 3 and discussed in Section 4.2.

2.3 CAP MONITORING

2.3.1 Cap Chemistry

Coring of the constructed caps in Areas 1, 3, 8, and in the non-capped Area 4/5 was conducted from September 21-24, 2015. The data were collected to evaluate the effectiveness of the caps in protecting benthic fauna from direct contact with contaminated sediments at unacceptable levels, and to verify that contaminant migration within the cap does not cause exceedances of benchmark concentrations over time. The scope of this cap monitoring did not include cap coring in Area 2 (consistent with the OMMP and recent previous monitoring events) because a large portion of Area 2 contains the Amended Cap.

A grid system based on the transects used in the ARI (JCO, 1997) was developed for random selection of sediment monitoring locations within Areas 1, 3, 4/5, and 8. This grid system was based on east-west Transects through the Turning Basin and Canal at 100 foot intervals and in wetland areas in Areas 3 and 4/5 at approximately 50-foot intervals in the north-south direction. The Turning Basin and Area 3 grids include points spaced 50 feet apart along transects in the east-west direction. The Area 4/5 grid has points spaced 20 feet apart in the east-west direction. Three locations on each transect at 20, 40, and 60 feet offsets from the West Bank of the Canal were included in the sample location selection grid. The purpose of the grid system was to define the array of possible sampling locations from which the *Site Specific*

Method No. 77 for Stratified Random Selection of Sample Location was used to determine the coring locations. The number of randomly chosen specific sampling locations was as follows: four in Area 8, three in Area 1, two in Area 3, and three in Area 4/5. Core locations for sampling and chemical analysis were selected at the following specific locations (as shown on Figure 2-5):

Area 8 (Turning Basin)

J_T1+00-E50
J_T2+00-E100
J_T3+00-E100
J_T3+00-E300

Area 1 (northern Canal)
J_T5+00-E20
J_T6+00-E60
J_T8+00-E40

Area 3 (wetlands cap)
J_T15+50-E100
J_T16+50-E150

Area 4/5 (non-capped wetlands & tributary area)
J_T17+00-E400
J_T21+00-E25
J_T21+00-E50

The depth intervals from which samples were collected for chemical analysis varied between study areas as specified in the CMWP. The intervals in Areas 1, 3, and 8 for the randomly selected locations included surface (0 - 10 cm) and mid-cap depths. The mid-cap intervals were determined to be the approximate middle third of the cap based upon field measurements at the time of sampling. Sample intervals in the non-capped Areas 4/5 were surface only (0 - 10 cm). Cap and sediment samples were collected from the 12 locations described above and submitted for laboratory analyses between September 21 and 24, 2015.

A minimum of two replicate samples were collected from each random coring location. Samples were composited on-site in accordance with *Site Specific Method No. 26 for Preparation of Soil/Sediment Composite Sample for Non-Volatile Constituents*, and the

composited samples were placed in the laboratory-supplied sample containers. Samples for analysis were shipped in chilled coolers under Chain-of-Custody in accordance with *Site Specific Method No. 7 For Chain-of-custody Records* to Lancaster Laboratories, Inc. where they were analyzed for: SVOCs (17 PAHs) by EPA 8270C; metals (RCRA 8 plus Cu and Zn) by EPA 6010b; Total Organic Carbon (TOC) by Lloyd Kahn Method; and percent solids. Results of the chemical analyses are summarized in Appendix 3 and discussed in Section 4.3.1.

In the Canal and Turning Basin (Areas 1 and 8), subaqueous cap core samples were collected from a barge in butyrate core liners using a two-inch diameter, 3-foot long Wildco™ corer equipped with a positive closure ball valve device at the top of the core liner. No baskets or other retaining devices were used below the liner. The Wildco™ corer was advanced by hammering it into the cap with a sledge hammer. The barge was held in position by ropes attached to anchors or trees on-shore, and the position was verified with a Trimble sub-meter global positioning system (GPS). Submersible anchors or spud poles were not used during cap coring.

The cap thickness was determined at each subaqueous sampling location prior to the collection of the cores by pushing or hammering a fiberglass rod into the cap to refusal (the geotextile layer). The Wildco™ corer was then advanced to either the bottom of the cap (represented by the location of the geotextile), or the full length of the core barrel (36 inches), whichever was shorter. Each core was advanced through the entire cap thickness or to the maximum 36-inch core barrel length and a minimum of two replicate cores were collected from each location. Recovery was sufficient in at least one of the replicates at each location (minimum of 42%, and an average of 64% of the core penetration/cap thickness) to provide sufficient volume of sample from the middle third of the cap as required for laboratory analysis. The cap thicknesses at the sampling locations ranged between 25 and 46 inches.

The samples from Area 3 were collected using a decontaminated Dutch soil auger which was advanced to refusal on the geotextile beneath the cap. The measured thicknesses of the cap

in Area 3 at the two sampling locations were 12 and 15 inches. Samples from Areas 4/5 were collected with the auger or a steel spade. All sampling equipment was decontaminated between locations in accordance with *Site Specific Method No. 27 for Decontamination of Field Equipment*.

2.4 AMENDED CAP MONITORING

2.4.1 Amended Cap Settlement Plate Survey

On August 25, 2015 a survey was completed by LRS of the nine settlement plates installed on the Amended Cap in 2010. The work was completed in general accordance with the September 16, 2011 OMMP conditionally approved by EPA on October 28, 2011. The settlement plates were initially surveyed following their installation on December 10, 2010 by LRS, and have been surveyed at approximately 6-month intervals since 2011.

Survey measurements of the settlement plate elevations were made using a total station and reported to +/- 0.1 foot vertical accuracy using the NAVD88 datum. Location measurements were performed using a total station transit. Existing LRS temporary benchmarks were used as positional control for the location survey. The location survey was performed with +/- 0.1 foot horizontal accuracy and referenced to the Vermont State Plane, NAD83 datum. Results of the survey are presented in Section 4.4.2.

2.4.2 Visual Sheen Monitoring

Visual Sheen inspections were conducted bi-weekly from April to November in 2015. Visual sheen monitoring was conducted at 43 different locations in the vicinity of the Amended Cap between T8 and T13 (11 locations along each of the east and west banks spaced 50 feet apart and 21 locations along the middle of the Canal spaced 25 feet apart). At each location, the surface of the water was observed for five minutes in each direction (northeast and southeast along the west bank, northwest and southwest along the east bank, and north, south, east, and west from positions in the middle of the Canal). The purpose of these inspections was to note the presence of gas bubbles (and any associated sheens or NAPL) rising to the surface of the

Canal near the Amended Cap. Results of the sheen monitoring conducted in 2013 are summarized in Section 4.4.3.

2.4.3 Cap Termination Inspections

Visual inspections of the edges of the Amended Cap were conducted on a monthly basis from April to November 2015. Results of these inspections are provided in Section 4.4.4.

2.5 BIOLOGICAL MONITORING

2.5.1 Benthic Survey

Benthic macroinvertebrate and sediment sampling was performed on September 22 and 23, 2015. Samples were collected in Areas 8, 1, and 4/5 using an Ekman grab sampler, as described in *Site Specific Method #28 For Sediment Sampling Using Ekman Grab*. Three replicate benthic macroinvertebrate samples and a composite physical/chemical parameter sample were collected at each sampling location. Sample locations were selected in Area 8, Area 1, and Area 4/5 using the Stratified Random Sampling Method described in *Site Specific Method #77 For Stratified Random Selection of Sample Location* of the CMWP. The portion of Area 2 that has been covered by the Amended Cap was not included in the sediment or macroinvertebrate sampling program. The sample locations are shown on Figure 2-5, and are described below:

- Turning Basin, Area 8: J_T1+00E50
- Canal, Area 1: J_T6+00E60
- Area 4/5: J_T21+00E50

Each benthic macroinvertebrate sample was passed through a #30 sieve bucket in the field to collect the macroinvertebrates. The macroinvertebrate samples were preserved in the field with denatured ethanol, and delivered within 30-hours to Aquatec Biological Services, Williston, Vermont, for enumeration and taxonomic identification. The enumeration and identification were performed following the protocols presented in Appendix F of the Vermont Indirect Discharge Permit rules consistent with the CMWP. Composite sediment samples

collected concurrently with the macroinvertebrate samples were also prepared for Acid Volatile Sulfide/Simultaneously Extracted Metals (AVS/SEM), Total Organic Carbon (TOC), and grain size analysis following CMWP *Site Specific Method #80 For Preparation of Soil/Sediment Sample for AVS/SEM Analysis* and *Site Specific Method #26 For Preparation of Soil/Sediment Composite Sample for Non-Volatile Constituents*, respectively. The sediment samples were sent to Lancaster Laboratories, Inc. for AVS/SEM, TOC (Lloyd Kahn Method), and grain size (ASTM-D422) analyses. Benthic survey monitoring data are summarized in Appendix 3 and discussed in Section 4.5.1.

2.5.2 Aquatic Vegetation

Observations of aquatic vegetation over the subaqueous cap on the Site were made on September 22-23, 2015, during the benthic macroinvertebrate sampling. The results of the qualitative vegetation monitoring are presented in Section 4.5.2.

2.6 WEIR INSPECTION

The outlet weir was inspected for settlement, erosion and integrity; the elevations of the weir and the adjacent railroad bridge were surveyed on August 26, 2015. The inspection included a visual assessment of those portions of the weir above ground, as well as a visual assessment of the integrity of portions of the rip-rap. Autolevel survey measurements were collected to determine the relative elevations of the weir abutments and the railroad bridge abutments. Results of the inspection and survey of the weir are presented in Section 4.6.

2.7 SEDIMENT TRANSPORT MONITORING

2.7.1 Trigger Stage Modeling

For 2015, a trigger stage elevation of 97.55 feet NAVD88 was utilized. The CMWP specifies that the trigger stage elevation be set at the highest previously measured storm stage elevation during which outlet water quality samples did not contain detectable contaminant concentrations exceeding the laboratory reporting limits. The 97.55 feet elevation trigger limit was defined during a stormwater event sampled in October 20, 2012. During that storm the

highest Canal stage elevation measured was 97.55 feet and the laboratory analysis of the composite water sample collected from the Turning Basin outlet during the storm did not report contaminant concentrations above the reporting limits.

2.7.2 Stormwater System Setup and Monitoring

The stormwater sampling system was installed on April 15, 2015. The stormwater sampling system is comprised of an ISCO Model 3700 automated sampler connected to a DataTaker DT80M (Thermo Fisher Scientific) data logger with an internal cellular modem which is programmed to monitor surface water stage level fluctuations in the Canal on hourly intervals. An electronic tipping bucket rain gage was installed to track hourly rainfall. All components were calibrated to ensure accurate measurements, and the data logger was programmed. If the Lake stage is below the top of the weir, and the Canal trigger elevation is exceeded, the program initiates sampling by sending an alarm text message to a dedicated cell phone three times, and then pulsing the ISCO sampler. The program is written so subsequent samples are then automatically collected hourly for 12 hours. One 10-psi Campbell Scientific pressure transducer was used to monitor stage fluctuations in the Canal, approximately 80 feet east of the weir.

A transducer was not placed in the Lake during the 2015 season, as described in the CMWP, because of periodic damage to the transducer cable by beavers in previous years. Instead, the Lake stage elevation was monitored on an on-going basis during the monitoring period via the United States Geological Survey's (USGS) website by downloading continuous stage elevation data from USGS Gaging Station #4294500 (Lake Champlain at Burlington VT) to determine if the Lake level was below the elevation of the outlet weir during the sampling season. Successful function testing of the stormwater system was performed on April 15th, 2015.

The ISCO sampler was connected via Teflon-lined tubing to a stainless steel intake tube set in the western-most deep portion of the Turning Basin, approximately 80 feet east of the weir, at approximately 0.6 feet above the bottom. An internal wireless modem connected to the data

logger enabled routine data transfer from the data logger via e-mail on a three day interval. Additionally, the wireless modem allowed the data logger to make an alarm call to JCO personnel announcing if sampling had been initiated in the event of a Canal stage trigger elevation exceedance. The location of the stormwater sampling intake and pressure transducer is shown in Figure 2-4. All above-water system components were located inside a locked enclosure adjacent to the Turning Basin throughout the monitoring season.

The lake level was above the elevation of the weir from initial setup in April until approximately May 18th, and again from approximately June 15th until August 6th. During these periods, the automated sampler was disabled, as it is a requirement that the lake level be below the elevation of the weir to ensure that potential samples represent water that is flowing from the canal to the lake.

2.8 RESTORATION AREA MONITORING

Two monitoring events of the post-Amended Cap remediation restoration efforts were conducted at the Pine Street Canal Site; on June 10, 2015 and September 24, 2015. Monitoring of the off-site restoration area at the Ethan Allen Homestead was conducted on June 11, 2015. The results of these monitoring events are summarized in Section 4.8, and the full Restoration Area Monitoring Report is provided in Appendix 9.

3.0 LABORATORY RESULTS AND QA/QC

3.1 LABORATORY RESULTS AND VALIDATION

Chemical analyses for surface water, groundwater, and cap chemistry samples (surface and mid-cap cores) collected during the summer and fall 2015 compliance monitoring were performed by Eurofins Lancaster Laboratories, Inc. (Lancaster). Summary tables of all analytical results and groundwater field parameters are presented in Appendix 3. Enumeration and taxonomic identification of macroinvertebrate samples was performed by Aquatec Biological Services, Williston, Vermont. Composite sediment samples collected concurrently with the macroinvertebrate samples were analyzed for acid volatile sulfide/simultaneously extracted metals (AVS/SEM), total organic carbon (TOC), and grain size by Lancaster.

Summaries of the reported results for equipment blanks and other quality control samples associated with field procedures which were not independently validated and Quality Assured (QA) are presented in Section 3.2.

The September 2015 cap core sample group was validated by the Independent Data Validator (IDV), Phoenix Chemistry Services, Inc., per the schedule outlined in the CMWP. In accordance with Table 4-1 of the QAPP, 10 percent of the water samples are subject to independent data validation. The data validation for 2015 water samples was previously performed on the spring 2015 groundwater sample group, thereby fulfilling this requirement.

Consistent with the requirement that all cap core data be independently validated, the laboratory reports for the cap core samples were delivered to the IDV for validation. Sections of the IDV report on the validated sample delivery group for the cap core samples collected September 21- 25, 2015 (Lancaster SDG Nos. PSC24 and PSC27) were received at JCO from December 7-16, 2015. Discussions of the independently validated quality control sample results for the cap core samples are presented in Section 3.4.2.

3.2 LABORATORY QUALITY ASSURANCE ON NON-VALIDATED DATA

Surface Water –September 2015

The September 2015 surface water sample was collected September 22, 2015 and shipped via overnight courier on September 24th along with a duplicate, a field blank, and matrix spike/matrix spike duplicate to Lancaster under chain-of-custody protocol. A Procedure Deviation Alert (PDA) has been prepared documenting incorrect SIN designations on the chain-of-custody and sample labels for the field duplicate and field blank respectively. The PDA is included with this report in Appendix 8. The laboratory report (SDG PSC25), received on October 7, 2015, reported no detectable concentrations of PAHs in the surface water sample (J_T1+50W80, SIN 0179-24) or in the field blank (J_SW-FB, SIN 0123-22FB). The laboratory reported very low estimated concentrations (J) in the field duplicate (J_SW-DP, SIN 0122-24DP) of 0.1-0.2 micrograms per liter (μg/L) for benzo(b)fluoranthene, fluoranthene, and pyrene. The limit of quantitation (LOQ) was 0.5 μg/L and the method detection limit was 0.1 μg/L.

The laboratory narrative (included in the laboratory report for SDG PSC25 in Appendix 6) indicates that the analyses of the field samples and associated method blank, lab control sample (LCS) blank spike, matrix spike (MS), matrix spike duplicate (MSD) and surrogate recoveries were all within the method-prescribed quality control (QC) criteria.

Sediment Grab Samples Associated with Biological Monitoring – September 2015

Sediment grab samples collected September 22-23, 2015 with the benthic macroinvertebrate samples were analyzed for percent solids, TOC, and AVS/SEM. The sample group for macroinvertebrate inventory was field preserved and delivered to Aquatec Biological Sciences on September 23, 2014. The samples specified for AVS/SEM, TOC, grain size, and percent solids were shipped via overnight courier to Lancaster. The samples were received chilled at 1.5 º centigrade. The narrative in the lab report for benthic samples (SDG PSC26 in Appendix 6) reported no difficulties with the analyses of grain size and TOC. However, abnormally high TOC concentrations with respect to historical data were reported. When questioned by JCO, Lancaster provided further information on the TOC analyses, and produced a

revised report of TOC analysis on December 16, 2015. The abnormally high TOC results were caused when the subcontracting laboratory, Eurofins Spectrum (Agawam, MA) provided results to Lancaster that were reported in dry weight. Lancaster then incorrectly adjusted the Spectrum results again to dry weight, causing order-of magnitude higher TOC results. The revised data reflecting the correct TOC concentrations was added to the JCO database. A summary of the correct TOC concentrations is included with this report as Appendix 3, and copies of the revised analytical reports are included as Appendix 6.

Copper, lead, and zinc were reported present in the sediment parent and field duplicate samples, J_T6+00E60 (SIN 0489-13) and J_0182-12DP (SIN 0182-13DP), respectively. The relative percent difference (RPD) for lead exceeded the 50% acceptable limit for solid samples as specified in the QAPP. The RPD between the two samples was 173% for lead. However, the laboratory performed an analysis of a lab duplicate (lab sample identification 0489-13DUP), which exhibited an RPD of 7% for lead, when compared with the parent sample, indicating variation in the sediment, rather than lab errors. RPDs of the parent and field duplicate samples were 10% for AVS by wet chemistry, 9.2% for TOC, 24% for copper, and 17% for zinc, all of which were within the 50% acceptance limit. Other quality issues associated with the laboratory analyses included:

- detection of lead in the laboratory method blank;
- unacceptably low recoveries of copper, lead, zinc and mercury in the matrix spike and/or matrix spike duplicate samples;
- an unacceptably high RPD (41%) above the 20% limit for AVS analyses of the parent and lab prepared duplicate sample. However, the result of the parent and duplicate samples were less than five times the LOQ.

Some of the quality issues described above may be due to inherent variability in the sediments, variation due to collection and/or decanting procedures, and/or interference from the matrix composition. However, the QA/QC data indicate insufficient accuracy and/or reproducibility for copper, lead, zinc, mercury and AVS/SEM analyses. Therefore, the reported

values for these analytes have been flagged as estimated in the JCO data base with a "J" or "UJ" as appropriate.

Groundwater Samples - October 2015

The fall 2015 groundwater sampling was conducted October 5-7, 2015. The samples were collected into laboratory supplied preserved containers (as appropriate) and delivered on ice at temperatures between 0.4 – 2.8º centigrade under chain-of-custody procedures to Lancaster for analysis by Methods 8260B, 8270C, 6010B, 6020 and 7470A. Lancaster assigned the fall 2015 samples to the following sample delivery groups: PSC28 and PSC29. The final laboratory reports were received October 20-22, 2015 and are provided in Appendix 6. Splits of the groundwater samples collected at J_MW-21B (SIN 0082-33) and T_MW-25B (SIN 0500-04) were used as replicate (RP), MS and MSD samples. Spike recoveries and reproducibilities were all within Pine Street QAPP guideline limits.

Three trip blanks were collected and analyzed with the fall 2015 groundwater samples. Two field blanks were submitted with the fall 2015 samples. The laboratory data reported by Lancaster indicated no compounds or analytes present in any of the field, trip or laboratory blanks analyzed with the groundwater sample groups.

With respect to the two field duplicate sample pairs, detectable concentrations in the parent (J_MW-22A; SIN 0081-33) and field duplicate sample (J_0085-33DP) were reported for numerous analytes. The RPDs calculated for the results above the LOQ of the field duplicate pairs were all far below the maximum limit of 30% for aqueous field duplicate reproducibility. No detectable compounds were reported in the duplicate pair collected at T_MW-25B (SIN 0500-04) and its duplicate T_0509-04DP (SIN 0509-04DP).

3.3 FIELD PROCEDURES QA

Field sampling procedures were performed during the reporting period in conformance with the site specific methods and procedures listed in the QAPP and FSP, except where

documented otherwise (see Procedure Deviations below). QA/QC batch samples (i.e., field duplicates, equipment blanks, matrix spike, matrix spike duplicates, and trip blanks) were collected and submitted with each respective sample group to the laboratory for analysis per the QAPP.

Field Calibration

All field and monitoring instruments were calibrated in accordance with applicable Site Specific Methods and manufacturer's instructions. The calibration log sheets are included with the field forms in Appendix 1.

Procedure Deviations

Procedure Deviation Alerts (PDAs) have been prepared for any apparent discrepancies with Site Specific Methods that were brought to the attention of the QA/QC Officer by the Field Manager or technicians, or that were discovered by the QA/QC Officer during review of project documentation during audits.

Copies of all PDAs for the monitoring activities described in this report are included in Appendix 8, and are primarily attributed to incorrect sample identifications on sample labels and the accompanying chains of custody. No adverse impacts to the quality of the data set have occurred due to the minor deviations from the Site Specific Methods which occurred during the monitoring period.

Project Database

Laboratory analytical data, once received from the laboratory (and/or the Independent Data Validator, if applicable), were logged and entered into The Johnson Company database for each applicable sample media. Electronic entries were back-checked against the lab sheets by a second Johnson Company scientist following their addition to the databases. All updated entries were observed to be correctly entered.

3.4 INDEPENDENT DATA VALIDATION

3.4.1 Overview

The IDV for the project is Deborah Gaynor, Ph.D., Phoenix Chemistry Services of North Ferrisburg, Vermont. In accordance with Table 4-1 of the QAPP, an annual minimum of 10 percent of the water samples (e.g., groundwater, surface water, and stormwater), and 10 percent of the cap core samples, are subject to independent data validation. Data validation was performed on the spring 2015 groundwater sample delivery group and presented in the Spring 2015 Compliance Monitoring Report. The spring 2015 data validation satisfied the annual minimum requirement for water samples; therefore, no independent data validation was performed on the fall 2015 groundwater or surface water analytical results.

The September 2015 cap coring event consisted of Lancaster Sample Delivery Group Nos. PSC24 and PSC27. Since the September 2015 cap coring is the only such event for the year, all of the cap core data were validated by the IDV.

A summary of the IDV's findings for the cap core analyses is presented in Section 3.4.2 below. The IDV's complete data validation reports are included in Appendix 8.

3.4.2 Cap Core IDV Summary

3.4.2.1 PAHs

Laboratory results for PAH compounds in the September 2015 cap core samples (Lancaster SDG Nos. PSC24 and PSC27) were determined to be valid by the IDV with the following qualifiers:

- On the basis of unacceptable precision in the field duplicate pair, the results for pyrene, acenaphthylene, phenanthrene, anthracene, flouranthene, benzo(a)anthracene, chrysene, benzo(b)fluoranthene, benzo(k)fluoranthene, benzo(a)pyrene, indeno(1,2,3-cd)pyrene and benzo(g,h,i)perylene in the shallow (0-10 cm) core sample J_T15+50E100 and its field duplicate J_0164-13DP were qualified as estimated (J). Acenaphthylene in T15+50E100 was already estimated (J) as it was detected below the sample specific practical quantitation limit (PQL).

- The laboratory appropriately applied "J" qualifiers to the sample results when the concentration of an analyte was less than the sample-specific PQL.

The IDV reported that Chain of Custody records were present and completed accurately.

Data presentation was reported by the IDV as acceptable with the following exceptions:

- Decanting logs were not included in either data package (PSC24 and PSC27).

- There were missing forms in the data package related to instrument tuning, continuing calibration, and internal standards for the group of samples analyzed on October 5, 2015 by the analytical instrument HP 09910. The raw data associated with these analyses included with the data package was reviewed by the IDV, and appropriate criteria were observed to have been met.

- The IDV has requested the missing documentation from the laboratory, which when received, should be maintained in the IDV's report as Appendix C.

3.4.2.2 Inorganics

Laboratory results for the inorganic analytes in the September 2015 cap core samples (Lancaster SDG Nos. PSC24 and PSC27) were determined to be valid by the IDV with the following qualifiers:

- Based on laboratory blank contamination, the results for arsenic and selenium in all samples reported at concentrations below their respective limit of quantitation (LOQ) were qualified as less than the LOQ (U). Field blanks were not qualified based on the laboratory blank contamination.

- Based on field blank contamination, results for cadmium and mercury reported in all samples below their respective LOQ were qualified as less than the LOQ (U). Field blanks were not qualified based on laboratory blank contamination.

- Based on poor precision in the laboratory duplicate pairs, results for barium and copper in all cap core samples in SDG PSC27 were qualified as estimated (J).

- Based on poor reproducibility in an associated field duplicate pair, results for chromium in all cap core samples in SDG PSC27 were qualified as estimated (J).

- Based on the matrix interferences observed in the serial dilution, results for copper in all cap core samples in SDG PSC27 were qualified as estimated (J).

- The laboratory reported all results to the LOQ or reporting limit in the analysis results section of the data package; however, target compounds detected in the associated samples below the LOQ but greater than the MDL were reported on the Form I's with a "J" (estimated) qualifier. The "J" qualifiers were not removed by the validator, unless previously qualified, based on laboratory or field blank contamination (discussed above). Analysis Form I's included in the metals section of the data packages used "B" qualifiers for values less than the LOQs. These Form I's were disregarded in the validation effort since the laboratory also reported results with a non-detect to the concentration of the MDL. As stated in the case narrative (Appendix 6) the Instrument Detection Limits (IDLs) are used for determining the U flags (non-detects) on the initial and continuing calibration blanks. The highest IDL is selected when multiple instruments are used for an analysis. The MDLs are used for determining all other U flags.

The IDV reported that Chain-of-custody (COC) and internal COC records were present and completed accurately. Lancaster data presentation was acceptable with the following exception:

- The form documenting analytical instrument tune information (Form 15) was missing from the data package. The tune data was found in the raw data and was observed by the IDV to be acceptable.

- The missing form has been requested from the laboratory and when received, should be maintained in the IDV's report in Appendix C.

3.4.2.3 Total Organic Carbon

Based on the IDV's findings, results for the analyte TOC in all samples were determined to be valid as reported in SDG Nos. PSC24 and PSC27.

- A revised report for the TOC results was submitted to JCO December 16, 2015. The revised report was required since on the original report dated November 23, 2015, analytical weight determination was performed by Eurofins Spectrum prior to the Lloyd Kahn analysis for TOC. The percent moisture correction performed by Lancaster incorrectly raised the TOC results by orders of magnitude. The correct results were re-submitted in the December 16, 2015 revision.

The IDV reported Lancaster documentation (Chain of Custody records) were present and accurately completed for reported samples in this TOC data set. Data presentation was acceptable with the following exceptions:

- Missing raw data for the initial calibration curve performed on instrument TOC2 on July 24, 2015 was requested by the IDV and provided by the laboratory on December 8, 2015.

- The IDV requested that the laboratory verify that correct samples had been analyzed and reported since sample identifiers used within the raw data in SDP PSC27 were not identical to the laboratory IDs used for reporting. The lab reported that the analyst mis-typed the IDs and that the software did not allow corrections, however, the correct samples had been analyzed.

- A revision of the TOC Analysis Reports from Lancaster and the full report from Eurofins Spectrum was submitted for each data package on December 16, 2015. Due to the size, the full data packages have not been attached to the IDV's report. These data packages have been inserted into the previously received reports, replacing the Analysis Reports and TOC sections of the original data packages.

3.5 DATA USABILITY

Based on the IDV reports (Appendix 8), JCO review of the non-validated data, and the overall data quality objectives outlined in Section 1.5 and Section 4.3 of the QAPP (Reconciliation with Data Quality Objectives), all of the laboratory data provided by Lancaster are considered useable for the purposes of Compliance Monitoring.

4.0 DATA SUMMARIES AND EVALUATIONS

4.1 GROUNDWATER

4.1.1 Hydrology

4.1.1.1 General Dynamics (G.P. Burlington North, LLC, or Gilbane)

The CMWP requires a potentiometric analysis of shallow groundwater at the Gilbane property based on data collected from monitoring wells WE-89-5S, WE-89-6S, WE-89-7S, J_FLA-1 and J_FLA-4. It is assumed that these wells, which are screened in the surficial fill unit, are hydraulically connected to the Canal; therefore, the Canal stage was incorporated into the potentiometric evaluation.

The resultant potentiometric maps for the fall 2015 and the previous two monitoring events on the Gilbane property are shown on Figures 4-1 through 4-3. The data from fall 2015 are very similar to those recorded during the previous two events, and indicate flow from the Gilbane property primarily to the north, west and east towards Area 3, the railroad and Areas 4/5, which is generally consistent with the prior monitoring events. The water levels in the wells on the Gilbane property were all at least 1.9 feet above the Canal stage on October 5, 2015.

4.1.1.2 Wells West of Canal

As discussed in the Fall 2000 Pre-Construction Compliance Monitoring Report, the three-zone cross section delineation proposed on Figure 4-1 of the CMWP Field Sampling Plan has been reduced to the two-zone delineation (Zone A and Zone B) that is shown for north-trending cross section P-P' on Figure 4-4 of this report (the P-P' cross section location in plan-view is shown on Figures 2-1, 4-8 and 4-10). Because only two wells are present in the upper sand layer shown on Figure 4-4, a plan view potentiometric map for this stratigraphic unit could not be constructed. Therefore, as with previous reports, only wells screened in the Zone B sandy unit were used to create plan view potentiometric maps for the water level data.

The Zone B potentiometric map for the fall 2015 monitoring event is shown on Figure 4-5. Potentiometric maps for the prior two groundwater monitoring events (May 2014 and October

2013) are shown on Figures 4-6 and 4-7, respectively. The fall 2015 potentiometric data indicate a hydraulic gradient of approximately 0.008 feet/foot from the Canal towards the Lake based upon the water elevations in each. Other than the higher gradient calculated in October 2014 (of approximately 0.01 ft/ft) this is the highest gradient recorded by The Johnson Company since 2009, when the beaver dam at the Canal outlet was retaining approximately 1.1 feet of water above the weir crest. The fall 2015 data indicate that groundwater flow towards the Lake was near its maximum rate during the October 2015 groundwater monitoring event.

The fall 2015 water elevations and gradient in the vicinity of the Vertical Barrier indicate that the Barrier is holding water east of it up to an elevation of approximately 95.8 feet NAVD88 (see Figure 4-5). Water levels in wells on the west (Lake) side of the Barrier are considerably lower, at approximately 94.6 feet NAVD88 near the center of the Barrier. Water levels in wells near the north and south edges of the Barrier (MW-25B and MW-22A&B) are in between, approximately 94.8 to 95.15 feet NAVD88.

4.1.2 Chemistry

Portions of the Site were designated as "Class IV" groundwater in 1993, indicating that the groundwater is not suitable as a source of potable water. This designation acts as one of the institutional controls for the Site, and prohibits licensed well drillers from installing drinking water supply wells in the Class IV area. On January 23, 2006, the configuration of the Class IV area was changed by the Vermont Agency of Natural Resources. This change was made effective following discussions with the Performing Defendants and the EPA, notice to the affected landowners, public notice, and a public comment period. The 2006 delineation of the Class IV area is larger than the 1993 area, and has boundaries that generally follow property lines rather than an amorphous shape, which was difficult to identify in the field. The 2006 boundary is included in this report on applicable figures, including Figures 2-1, 4-8 and 4-10. The western edge of the 2006 boundary is defined as the approximate centerline of the railroad tracks (30 feet due west of the eastern edge of the Vermont Railway/State of Vermont Parcel #053-1-009-000).

A summary of the historical analytical results for all groundwater samples is provided in Appendix 3. The results for the targeted volatile organic, semivolatile organic, and inorganic compounds are discussed in the following subsections. Applicable maximum contaminant levels (MCLs) and Vermont Groundwater Enforcement Standards (VGES) for contaminants of concern which have been reported above one or both levels during Post-construction Monitoring are listed below in µg/L. The MCL is listed in bold type, and the VGES is italicized; **NA** */ NA* are listed if there is not an applicable standard.

- Benzene **5** / *5*
- Toluene **1000** / *1000*
- Ethylbenzene **700** / *700*
- Xylenes **10,000** / *10,000*
- Naphthalene **NA** / *20*
- Anthracene **NA** / *2,100*
- Benzo(a)pyrene **NA** / *0.2*
- Fluoranthene **NA** / *280*
- Fluorine **NA** / *280*
- Arsenic **10** / *10*
- Lead **15** / *15*

4.1.2.1 Volatile Organic Compounds – BTEX & Naphthalene

Figure 4-8 presents a plan view of the Site showing reported concentrations of benzene, toluene, ethylbenzene and xylenes (BTEX) and naphthalene for all wells sampled in October, 2015 as part of the routine long term monitoring program for the Site, including those added in 2014 to monitor the effectiveness of the Vertical Barrier. Reported BTEX and naphthalene concentrations in well clusters along Cross Section P – P' (from north to south: MW-9, MW-20, MW-25, MW-23 and MW-22) are shown on Figure 4-9. This section presents the most recent analytical results, which are further discussed in Section 4.1.2.4.

Eighteen wells along the railroad tracks were monitored for chemical quality. Wells with an "A" are water table wells, and wells with a "B" are deeper wells screened approximately 25-35 feet below ground surface. Eight of the wells had no detections of BTEX compounds or naphthalene in fall 2015; five of these wells were inside the Class IV groundwater boundary. Of

the other 10 wells, three wells within the Class IV groundwater boundary had detections of all four BTEX compounds: MW-22A & B, and MW-23B. These three wells also had detections of naphthalene. MW-23B has historically contained DNAPL and BTEX compounds above the PQL since its installation in 2000. Seven of the wells with one or more BTEX/naphthalene detections are outside of the Class IV groundwater boundary: MW-21A & B, MW-24A, MW-27A & B, and MW-28A & B.

Benzene was detected in samples collected from MW-21A (450 µg/L), MW-21B (estimated 0.8 µg/L), MW-22A (1,500 µg/L), MW-22B (590 µg/L), MW-23B (380 µg/L), MW-27A (2 µg/L), MW-27B (73 µg/L), MW-28A (7 µg/L), and MW-28B (180 µg/L) during the October 2015 monitoring event. Seven of these nine wells reported benzene in exceedance of the VGES and EPA MCL of 5 µg/L. Four of the wells with benzene exceedances are outside the Class IV groundwater boundary: MW-21A, MW-27B, MW-28A, and MW-28B.

Xylenes were detected in four wells outside the Class IV groundwater boundary: MW-21A (13 µg/L), MW-24A (2 µg/L), MW-27A (estimated 0.5 µg/L), and MW-27B (6 µg/L). Ethylbenzene was only reported in one well outside the Class IV groundwater boundary: MW-27B (27 µg/L). Toluene was detected in MW-22A (15 µg/L), MW-22B (estimated 5 µg/L), and MW-23B (350 µg/L), but was not detected in any wells outside of the Class IV groundwater boundary. None of the detected TEX compounds were reported in excess of their respective MCLs or VGES.

Naphthalene was one of the analytes reported in the VOC analysis (Method 8260 – a purge and trap gas chromatograph/mass spectrophotometer method) for the Vertical Barrier monitoring well samples from MW-25B, MW-26A & B, MW-27A & B and MW-28A & B. Naphthalene was detected in two of those seven wells: MW-27A (8 µg/L) and MW-27B (100 µg/L). Naphthalene in MW-27B exceeded the VGES of 20 µg/L. Wells MW-27A & B are outside of the Class IV groundwater boundary.

The VGES or MCL exceedances by VOCs in October 2015 in wells located beyond the Class IV groundwater boundary are limited to MW-21A, MW-27A, and MW-28B.

4.1.2.2 Semivolatile Organic Compounds – PAHs

Figure 4-10 provides a plan view of the Site showing reported concentrations of 17 targeted PAH compounds for all wells sampled in October 2015. Reported PAH concentrations in well clusters along Cross Section P – P' (from north to south: MW-9, MW-20, MW-23 and MW-22) are shown on Figure 4-11. This section presents the most recent analytical PAH results, which are further discussed in Section 4.1.2.4.

Of the wells tested for PAHs by Method 8270 outside the Class IV groundwater boundary, only MW-21A had reported detections above the PQL of one or more target PAH in October 2015. Naphthalene was the only PAH detected above the PQL of 0.5 μg/L in MW-21A (590 μg/L reported by Method 8270, in comparison to 620 μg/L by Method 8260B) which exceeded its VGES (20 μg/L). No VGES or MCLs were exceeded for any other PAHs outside the Class IV groundwater area.

In October 2015, one or more PAHs were detected in five of the ten monitoring wells sampled and analyzed by Method 8270 from within the Class IV boundary. However, all of the reported concentrations are at or less than 1 μg/L except for MW-23B (all but two of the 17 targeted PAHS), and MW22A & B (naphthalene and acenaphthene only). The highest reported individual PAH concentrations in October 2015 were reported in MW-23B (3,100 μg/L for naphthalene and 690 μg/L for 2-methylnaphthalene). These concentrations are similar to those reported for MW-23B since 2013, when the Vertical Barrier was installed.

Only five of the 17 targeted PAHs have established MCLs and/or VGES (see list above in Section 4.1.2). The only exceedances of these standards in October, 2015 were values reported for benzo(a)pyrene and naphthalene. MW-23B had a value of 2 μg/L for benzo(a)pyrene, and 3,100 μg/L naphthalene. As described previously (and summarized in

Section 4.1.3), visual evidence of NAPL was detected in this well during this and previous monitoring events. Naphthalene was detected (by Method 8270) above the VGES in three other wells in October, 2015: in MW-21A (590 μg/L); MW-22A (600 μg/L); and MW-22B (680 μg/L).

4.1.2.3 Inorganic Compounds – Metals

Arsenic was the only reported analyte with exceedances of its MCL and/or VGES of the metals analyzed during the October 2015 monitoring event (current MCL of 10 μg/L). These exceedances were limited to samples from the following two wells: MW-9A (16.1 μg/L), and MW-21B (72.8 μg/L; see Figure 4-15). Of these wells, only MW-21B is located outside the Class IV groundwater boundary. Lead has historically been detected in samples from MW-20B above the MCL of 15 μg/L (Figure 4-14), but was not detected above the MCL in any well in October 2015.

4.1.2.4 Temporal Changes in Concentrations: Effectiveness of the Vertical Barrier

Figure 4-12 shows the hydraulic gradient between the Canal and Lake Champlain and historical benzene concentrations since 2000 in wells MW-21A & B, MW-22A, and MW-24A. Figure 4-13 shows historical benzene concentrations for MW-21A, MW-23B and the DNAPL thickness in MW-23B. MW-23A was excluded from the water quality monitoring program per the CMWP and FSP due to the presence of NAPL in that well. Because of the persistent elevated benzene concentrations in some of the wells west of the Canal, the Performing Defendants installed an approximately 250 foot north-south Vertical Barrier between MW-23B and the railroad tracks in the fall of 2013 to reduce the groundwater flux and possible NAPL migration from the Canal towards the Lake. The location of this Vertical Barrier is shown on Figures 2-1, 4-5, 4-8 and 4-10.

MW-23B is up-gradient of the Vertical Barrier, and has historically contained high concentrations of VOCs and PAHs (see Figure 4-13). This well, which is located within the Class IV groundwater boundary, is known to contain DNAPL, and has had reported

concentrations of benzene and naphthalene in exceedance of the MCLs/VGES for years. Reported VOC and PAH concentrations, as well as measurable DNAPL in MW-23B, increased slightly during the first monitoring event in May, 2014 after the installation of the Vertical Barrier, but have since stabilized or decreased. Additionally, BTEX and naphthalene concentrations in the MW-22 well cluster, directly to the south of the Vertical Barrier, have shown an increasing trend since 2013. Naphthalene was not detected in MW-24A (north of the Vertical Barrier) until April 2010, and concentrations stabilized between 2010 and 2014. Since May 2014, naphthalene has not been detected above reporting limits in MW-24A.

On the west and typically down-gradient side of the Vertical Barrier (see Figure 4-5), between the railroad tracks and the lake, BTEX and naphthalene concentrations have generally stabilized or slightly decreased since the Vertical Barrier installation in 2013. In MW-21A, benzene and naphthalene concentrations increased from 2008 to 2013, and although recent concentrations of these analytes were still reported above the MCLs/VGES for 2015, and the well is outside the Class IV groundwater boundary, they appear to have stabilized. Ethylbenzene and xylenes have significantly decreased since 2013 in this well. Benzene was first detected in 2009 in MW-21B, the deep member of the MW-21 well nest, and increased through 2013. In October 2015, benzene was not detected above laboratory reporting limits in this well. BTEX and naphthalene have both been reported in samples from the 2014 installed well cluster MW-27A & B, but have shown a generally decreasing trend throughout the last four monitoring events (see Appendix 3). No VOCs or PAHs were detected above laboratory reporting limits in any of the other wells installed along the Vertical Barrier in October 2015.

Arsenic concentrations in MW-21B exhibit a general increase since the initial well installation in 2000 with recent stabilization of concentrations (see Groundwater Metals Summary table in Appendix 3 and Figure 4-15). Lead concentrations in MW-20B have generally increased since 2001, but the most recent values suggest that lead is possibly stabilizing in this well. Increases in arsenic and lead appear to correlate with a similar general decrease of oxidation-reduction potential (ORP) (see Figure 4-14 & 4-15). The decrease in ORP

suggests development of a reducing environment, which could cause dissolution of existing naturally occurring metals in soils.

Looking at the trends demonstrated above, we can conclude the Vertical Barrier has effectively retarded groundwater and/or diverted groundwater flow slightly to the south. This has slowed and possibly prevented further migration of NAPL, and reduced the migration of dissolved contamination, under the railroad tracks to Lake Champlain.

4.1.3 NAPL Monitoring – Groundwater Monitoring Wells

Wells MW-1B, MW-3C, MW-4B, MW-12, MW-13, MW-17, MW-21A & B, MW-22A & B, MW-23A & B, MW-24A & B, and P-106 were monitored for NAPL in October 2015 (see Figure 2-2). MW-19 is part of the long-term DNAPL monitoring program, but was blocked at approximately 47 feet below top of casing, as compared with its 70-foot reported total depth. MW-8A is also part of the monitoring program, but could not be located visually or with a metal detector. We will attempt to locate this well again next year with a GPS. The results of the DNAPL monitoring/removal event in October 2015 in groundwater monitoring wells that are part of the long term NAPL monitoring program are shown on Figure 2-2. The NAPL Summary Table in Appendix 3 details the results of DNAPL monitoring in groundwater monitoring wells at the Site since 2000.

Measureable thicknesses of NAPL over 0.1 feet were noted in only three of the monitoring wells in October 2015: MW-17, MW-23A and MW-23B. DNAPL was removed from each of these wells on October 5, 2015, (removal is required when DNAPL thickness exceeds 0.1 feet). A summary of the October 5, 2015 NAPL measurement and removal data for MW-17, MW-23A and MW-23B is presented in Table 4-1. October 2015 DNAPL thicknesses in these wells are comparable to historical results.

TABLE 4-1
MONITORING WELL NAPL MONITORING AND REMOVAL SUMMARY – OCTOBER 2015

Monitoring Well	DNAPL Thickness – 10/5/15 (feet)	Historical Measured DNAPL Thickness (feet)	Approximate DNAPL removed – 10/5/15 (liters)
MW-17	0.17	2010-2015: 0.1-1.3	0.04
MW-23A	0.7	None between 2010 and spring 2012. 0.5 to 0.89 feet between fall 2012 and May 2015	0.4
MW-23B	2.5	2010-2015: 2.2-6.0	2

4.1.4 NAPL Monitoring/Removal – NAPL Recovery Wells

There are two sets of passive NAPL recovery wells; wells RW-111 through RW-114 located in the vicinity of the Vertical Barrier, and wells RW-101 through RW-110, RW9+80, RW10+25, RW11, and RW14 located adjacent to the Canal and Amended Cap (see Figures 2-2 & 2-3).

Monitoring in the Vertical Barrier recovery wells RW-111 through RW-114 installed in February 2014 was conducted in January, May and October 2015. No measureable NAPL (LNAPL or DNAPL) was present in these four wells during 2015.

Amended Cap NAPL monitoring and removal has been conducted (during the monitoring season) since August, 2011 in accordance with the OMMP and the August 9, 2013 EPA letter. Nine monitoring/removal events were completed every four weeks in 2015 from April to November.

Results of the 2015 monthly Amended Cap recovery well NAPL monitoring/removal events indicate that there is no measureable LNAPL (>0.01 feet thick) in any of the recovery wells. DNAPL monitoring and removal data for all the Amended Cap recovery wells are summarized in Table 4-2 (following this sub-section). Field notes collected during the NAPL monitoring and recovery are included in Appendix 1.

A total of approximately 1,275 gallons of DNAPL were removed from the Amended Cap recovery wells in 2015. A total of approximately 8,230 gallons of DNAPL have been removed since this monitoring task began in 2011.

Of the 14 Amended Cap recovery wells, all but RW-110, RW9+80, and RW11 contained greater than 0.1 feet of DNAPL on one or more days in 2015 and therefore required pumping. Total well depths of RW9+80 and RW11 are relatively shallow (6-8 feet), compared with the 30-40 foot depths of the most of other Amended Cap recovery wells; these shallow wells rarely contain DNAPL, as it sinks in the water column. RW-110 has required intermittent pumping in the past; however no measurable DNAPL was present during the 2015 monitoring season. RW-109 has consistently contained the largest quantity of DNAPL. Prior to each of the 2015 removal events, 22.0-22.5 feet of DNAPL was measured in RW-109, with 21.8-22.3 feet present on the second and third days of each event. Approximately 30 to 41 gallons of DNAPL were pumped (removed) from RW-109 on each of the three consecutive monitoring days.

In addition to RW-109, four other Amended Cap recovery wells required three successive days of DNAPL removal due to 24 hour recharge of more than 0.1 feet of DNAPL: RW-102, RW-103, RW-104 and RW-108. These wells had an average initial measured DNAPL thickness of 13.9 feet in April and between 2-9 feet at the beginning of each of the remaining 2015 monitoring events. The combined volume of DNAPL removed from these wells (excluding RW-109) was approximately 100 gallons in April, and between 19-38 gallons per month for the remainder of the 2015 monitoring period.

Two of the wells, RW-101 and RW-105, located on the west bank near the northern and southern edges of the Amended Cap, had less DNAPL than the three wells located between them (RW-102, -103 and -104). RW-101 initially had 5.6 feet of DNAPL in April, but contained 1.3 feet or less for the remainder of the year. RW-105 had an initial DNAPL thickness of 1.1 feet in April, and 0.5 feet or less for the remainder of 2015. Approximately 22.5 gallons of DNAPL were pumped from these two wells in 2015, which is the same as the total from 2014.

Two of the recovery wells, RW-106 and RW-107, both located on the east bank, required pumping only intermittently during the 2015 monitoring season due to DNAPL thickness greater than 0.1 foot. RW-106 was pumped once, and RW-107 was pumped twice. These two wells had between 0 and 0.1 feet of DNAPL present in April 2015, and between 0.0 and 0.5 feet in the remainder of 2015. A total of approximately 0.75 gallons of DNAPL were pumped from these two wells in 2015.

Notes: " -- " indicates no measurement and/or DNAPL removal performed

* Problems with the NAPL removal pumps - complete NAPL removal not possible

[1] - NAPL removal in large diameter wells with <0.3 ft. not practical. Past attempts proved ineffective with large amounts of water pumped and very little NAPL removed.

[2] - NAPL Removal impractical due to high water (well is in approx. 1 ft. of standing water on this date).

[3] - NM = Not measured; RW inaccessible due to ice across Canal.

[4] - PVC/suction fitting compromised, removal not possible. New PVC installed, allowed time for adhesive to set.

[5] - PVC/suction fitting compromised, removal not possible. Replaced with iron pipe before next monitoring event.

[6] - Compromised PVC was replaced with iron pipe and new fittings on 9/28/15.

[7] - Suction issues from 10/26/15 - 10/28/15; adjusted height of PVC which fixed the issue on 10/28/15.

4.2 SURFACE WATER

One unfiltered surface water sample (J_SWT1+50W80) and a field duplicate were collected from the Canal outlet on September 22, 2015 and analyzed for 17 PAHs. The sample location is shown on Figure 2-4 (primary long-term location). No PAHs were reported above laboratory reporting limits in either the parent sample or the field duplicate. The reporting limit

for each individual PAH was 0.5 μg/L. These data indicate that water quality in Lake Champlain, adjacent to the Canal outlet, was not adversely affected by Canal surface water at the time of sample collection.

Sections 6.2.1.6 and 6.2.1.7 of the FSP require that data evaluation include comparison of the analytical results to the current version of the Ambient Water Quality Criteria (AWQC). Additionally, for the years following Year 2 after construction completion (2005), a graph for each analytical parameter that illustrates changes in concentration over time is required. These graphs are to include the AWQC limits for each compound. No PAHs have been detected above the reporting limit in the available long-term surface water quality monitoring data, so the graphs were not prepared and comparison with AWQC was not performed. A summary table of all surface water analytical results (and the relevant AWQC), and a complete surface water sample results database printout, are presented in Appendix 3.

4.3 WETLANDS CAP AND SUBAQUEOUS CAP MONITORING

4.3.1 Cap Chemistry

Chemical analyses were completed on samples from cores of the wetland and subaqueous caps. The objective of the chemical analyses is to evaluate potential contaminant migration within the cap and to compare the mid-cap sample data with benchmark values set forth in the record of decision (ROD) and statement of work (SOW). Similar to the previous years since 2010, cap coring in Area 2 was not conducted during this monitoring event due to the presence of the Amended Cap in a large portion of Area 2. A summary of the laboratory analytical data and IDV reports are presented in Appendix 6 and Appendix 8, respectively. The cap core sampling locations are shown on Figures 2-5, 4-16 and 4-17. Field notes and sample forms are included in Appendix 1. Summaries of the analytical results are provided in Table 4-3.

Notes:

[1] Most PAHs were not detected in most mid-cap samples. Zero was used for non-detect analytes in calculating the sum of PAHs. No reporting limits were above 330 μg/kg, so ½ the reporting limit was not used in the summations.

[2] Benchmark value for Mid-Cap PAHs is sum of ERMs for 13 PAHs: 21 mg/kg, no benchmark for Top-Cap samples or Area 4/5 samples.

[3] Benchmark values for Mid-Cap metals are ERMs: copper – 270 mg/kg; lead – 218 mg/kg; mercury – 0.71 mg/kg; zinc – 410 mg/kg, no benchmark for Top-Cap samples or Area 4/5 samples.

[4] No Coring was performed in Area 2 during the fall 2015 monitoring period due to the presence of the Amended Cap

U – indicates that analyte was not detected above laboratory reporting limit, with the associated value being the reporting limit

J – indicates an estimated concentration

4.3.1.1 Long-term Monitoring Mid-cap Results and Comparison to Benchmark Values

A summary of the results and a comparison to benchmark values for the mid-cap samples is presented in Table 4-3. The CMWP, Field Sampling Plan, Section 5.3.2.4: *Data Evaluation*; and associated Figure FSP 6-8: *Long Term Cap Monitoring Data Analysis*, presents the data evaluation procedures for the chemical monitoring of the caps at the Site. The primary basis for data evaluation is a comparison of the mid-cap sample laboratory results to the following benchmark values: the sum of the effects range median (ER-Ms) for 13 PAHs (21 mg/kg; the "PAH benchmark value"), and individual ER-M values for copper, lead, mercury, and zinc (270 mg/kg, 218 mg/kg, 0.71 mg/kg, and 410 mg/kg, respectively).

If the reported concentration for an individual mid-cap sample exceeds a benchmark value but the average concentration of all mid-cap samples within the study area (e.g., Area 8) do *not* exceed the benchmark value, then the location with the exceedance is to be re-sampled as soon as practical. If the re-sampled value also exceeds the benchmark, a data evaluation and best professional judgment assessment is required. If the re-sampled value does *not* exceed the benchmark value then no additional action is required. If the mean concentration from all mid-cap samples within the study area exceeds a benchmark value, then a full weight-of-evidence analysis (including toxicity testing) is required.

No reported metals or PAHs from any of the capped areas exceeded the benchmark values. Four of the nine associated mid-cap samples contained detectable PAHs, although sum-of-PAH values reported were all less than 0.2 mg/kg, well below the 21 mg/kg benchmark value.

Note that neither the SOW nor the CMWP require a comparison of the results from top of cap samples (0-10 cm) or samples from the uncapped Areas 4/5 to the benchmark values.

4.3.1.2 Long-term Top-of-Cap Monitoring Results

Overall, each of the nine selected top-of-cap samples (0–10 cm) collected at random

sample locations from Areas 1, 3, and 8, had detected PAHs, though many of the detections were reported as estimated concentrations (J) below the PQL. The sum of PAH numbers shown in Table 4-3 were calculated using zero for non-detects in accordance with the CMWP, as all reporting limits were 330 μg/kg.

The sums of PAHs from the three shallow samples collected from the uncapped Areas 4/5 were elevated relative to most of the cap samples in other areas. However, TOC in these samples ranged from 6.5% to 21.5%, making the PAHs largely unavailable to the biota, again consistent with prior findings (see discussion of biological monitoring in Section 4.5). Copper, lead, mercury, and zinc were also elevated in the Area 4/5 samples relative to those collected from the capped areas, although they are consistent with prior results. Two samples from Area 4/5 included an exceedance of the 410 mg/kg zinc benchmark (J_T17+00E400: 709 mg/kg and J_T21+00E50: 976 mg/kg). Further discussion of the bioavailability of metals in Area 4/5 is provided in Section 4.5.1.2.

4.4 AMENDED CAP MONITORING

4.4.1 Amended Cap Settlement Plate Survey

An elevation and location survey of the nine settlement plates (SP-A through SP-I) placed on the Amended Cap was performed following its construction, and was also completed on August 25, 2015 by LRS. The first settlement plate survey following Amended Cap installation was completed on December 10, 2010, followed by surveys completed in November 2011, spring and fall of 2012, 2013 and 2014 and May 7, 2015.

As was the case with previous similar surveys, attempts to insert the survey rod into the cone and pipe located in the middle of the plates were generally not successful. The elevation and horizontal location were therefore measured from the top of the plate near the approximate center, which provides for a potential horizontal error of +/- two feet due to the two-foot by two-foot size of the plates.

As with similar surveys, several flat, hard surfaces (presumed to be concrete blocks due to their approximately 8 x 16-inch size) were detected on the Amended Cap surface while probing with the survey rod for the settlement plates. The presence of these blocks suggests that some of the previously reported locations for settlement plates may actually have been concrete block locations.

The location and elevation data from the most recent settlement plate survey are presented on Table 4-4 (at the end of this sub-section). The reported plate locations from the August 2015 and the initial 2010 surveys are also shown on Figure 4-18, along with the change in elevation and location (in feet) between the two surveys. The August 2015 data suggest that the plates are currently within +/- 2 feet horizontally of the locations provided by the 2010 survey, except Plates D, E and F, whose August 2015 positions were between 5-9 feet from their 2010 locations. The vertical survey data indicate the plate elevations are all within one foot of the 2010 survey, and between 0.3-0.9 feet higher than the elevations surveyed in May 2015.

Temporal variability of generally less than a foot in the settlement plate elevations has been documented since their installation in 2010 (see Figure 4-19 and Table 4-5), probably as a result of seasonal changes (recent data suggests higher elevations in August than in May), and to inaccuracies inherent in the survey method (survey rod placement by feel in murky underwater conditions). However, systematic increases or decreases in the elevations are not apparent in the data. The settlement plate survey data does not indicate significant settling, erosion, rebound or gas build-up which would adversely impact the performance of the Amended Cap.

4.4.2 Visual Sheen Monitoring

Visual sheen monitoring was conducted bi-weekly starting the week of April 13, 2015 through the week of November 23, 2015. A total of 17 Inspections were conducted at 43 different locations in the vicinity of the Amended Cap between T8 and T13 (11 locations along each of the east and west banks spaced 50 feet apart and 21 locations along the middle of the Canal spaced 25 feet apart). At each location, the surface of the water was observed for five minutes in each direction as specified by the OMMP (two observers were used for each location on the bank, one looking upstream, and one downstream; resulting in the full ten minutes of observations at each bank location required by the OMMP).

Areas of gas bubble emanation were observed during each sheen inspection event; with the number and frequency of the bubbling appearing to be generally correlated to seasonal changes of temperature and precipitation levels. The highest total number of gas bubble locations observed during the monitoring season was 66 in late July, with three being the fewest number of locations observed in late November. Gas bubbles have been observed within the

footprint of the Amended Cap, as well as to the north and south of the Amended Cap area.

To date, no sheens and and/or NAPL associated with gas bubbles have been observed emanating from within the Amended Cap footprint. Additionally, any sheens observed in the Canal (resulting from bubbles emanating from areas outside the Amended Cap) have dissipated prior to reaching the Turning Basin. No new areas of sheens were observed in 2015. As with the gas bubbles, the frequency of sheens and NAPL droplets associated with bubbles appeared to be generally correlated to seasonal changes with 1-4 locations observed during most events throughout the spring and summer, 0-3 locations observed in September and October, and none were present in November. Photographs of sheens are provided in Appendix 7, and bi-weekly interim reports and field forms in Appendix 1.

Gas bubbles with associated sheens and/or NAPL droplets were recorded at two locations (as compared to six in 2014) 45-102 feet north of Amended Cap footprint as shown on Figure 4-21 (North Seep Location Area), and at eight locations south of Amended Cap footprint (South Seep Location Area). All of these areas have had sheens observed in them over the past several years.

In accordance with the OMMP, since no release areas were observed emanating through the Amended Cap, no sheen/NAPL sampling was conducted.

4.4.3 Cap Termination Inspections

Visual examinations of the edges of the Amended Cap were conducted on a monthly basis from April to November, 2015. Photographs are included in Appendix 7. No significant areas of damage were noted during any of the inspections. A 6 foot by 3 foot area of the reactive core mat (RCM) is exposed along the eastern bank at approximately T11+85. A 3 foot diameter bubble had apparently formed under the TRM and RCM near T11+80 on the eastern shoreline, resulting in slight heaving. These areas were previously noted and do not appear to be expanding in size. These observations are considered relatively insignificant and are not adversely impacting the effectiveness of the Amended Cap.

4.5 BIOLOGICAL MONITORING

4.5.1 Benthic Macroinvertebrate Monitoring

Benthic macroinvertebrate sampling was conducted on September 22 and 23, including one sample randomly selected in the combined Areas 1 and 2; one in Area 8 (the capped section of the Canal); and one in the uncapped Area 4/5. The Amended Cap portion of Area 2 was not included in the sampling. The data tables are presented in Appendix 3 and the laboratory reports are in Appendix 6. Summary results from macroinvertebrate sampling in the individual study areas are presented in Tables 4-6 through 4-8. Comparisons of relative abundance and number of dominant species from the pre-construction sampling in 2001, and post-construction sampling in 2003 through 2015, are presented in Table 4-9. Table 4-10 presents sediment physical data and Table 4-11 presents AVS/SEM data. A comparison of AVS/SEM data from 2001 to 2015 for Area 4/5 is presented in Table 4-12. Locations of benthic samples are shown on Figures 2-5, 4-16 and 4-17. The benthic macroinvertebrate relative abundance data show the spatial heterogeneity that has been noted in previous years. These results do not appear to be the result of site contamination. The highest abundance was in Area 4/5 where the sediment contaminant concentrations are also the highest. The TOC content at the Area 4/5 biological sample location J_T21+00E50 was 21.9 percent. The SEM/AVS molar ratio was 0.1746 at J_21+00E50 indicating that metals contaminants are not bioavailable.

4.5.1.1 Benthic Macroinvertebrate Sampling

The sample from the Turning Basin, Area 8, showed the highest relative abundance since 2010 and the highest diversity since 2004 (see Table 4-9). The SEM/AVS ratio was 0.05 which indicates that metals would not be bioavailable. Total organic carbon content was 19.2 percent. The sample location was nearshore and the sediment contained much coarse organic material. This substrate probably accounts for the relative abundance and diversity at this location. Area 1/2 has shown the lowest relative abundance since 2006, but the sample has also shown the highest diversity since that year. As in 2014, tubificid worms were dominant but biting midges were a significant portion of the samples. The snail, *Valvata sp.*, was a significant portion of Replicate M2. The presence of earthworms, Lumbriculidae, in some samples in both the Turning Basin and Area 1/2 probably resulted from runoff from the shore. The measure of diversity in the capped area was strong this year, indicating a stable population.

The uncapped Area 4/5 had the greatest relative abundance and the diversity was the highest for this area since 2010. The dominant species were the naiad worm, *Dero sp.*, the isopod crustacean, *Caecidotea communis*, and snails *Physa* sp. and *Bithynia tenticulata*. The diversity in the samples from Area 4/5 was consistent with past data indicating that the benthic community is stable.

4.5.1.2 Sediment Physical/Chemical Characteristics

The sediment samples at J_T1+00E50 (Turning Basin) and J_T21+00E50 (Area 4/5) were primarily organic sediments. This location was very near the north shore and a great deal of plant material was present in the sample. Therefore, no grain size analysis was done on the sample. The grain size analyses, performed on the sample collected from the capped Area 1/2 in conjunction with biological sampling, indicated that the sediments at T6+00E60 in the Canal were silt loam (see Table 4-10). TOC reported in Area 8 was significantly higher than in Area 1 (see Table 4-10). As noted above, the sample location was very near the shore and the sample contained a lot of decaying plant material. TOC reduces the bioavailability of metal and organic contaminants. The ratios of SEM/AVS were less than one for Areas 8, 1 and 4/5, which indicates that metals are not bioavailable (see Table 4-11).

TABLE 4-9
COMPARISON OF RELATIVE ABUNDANCE AND DIVERSITY
BENTHIC MACROINVERTEBRATES

Area 1	J_T6+00E60[1]	5.8	2.55	NA	0.156	0.106	U	NA	1.05	0.5143
Area 4/5	J_T21+00E50	1.6	18.2	NA	0.302	0.0849	U	NA	2.79	0.1746

U – Sample was analyzed for the constituent, but it was not detected in the sample

NA – Not analyzed

[1] Values presented are the mean of the two duplicate samples.

In Area 4/5, the TOC concentrations reported were high indicating that PAHs are not readily bioavailable (see Table 4-10). The AVS/SEM ratio was less than 1 indicating that metals are not bioavailable. Based on these data, it appears that the native surficial sediments in Area 4/5 continue to function as a "natural cap" for contaminants present in the sediments.

4.5.1.3 Compliance with Performance Standards

The reduced dominance of the tubificid worms and the greater diversity in the benthic population indicates that the benthic community is becoming more stable. Extremely high dominance by one group of organisms is indicative of a relatively new community or a community that experiences frequent dislocation by external stressors. The increase in species diversity is a positive indicator for the benthic communities.

Comparisons of relative abundance and diversity over the 13 years of sampling data (see Table 4-9), show that spatial heterogeneity, or patchiness, continues to be evident. The very low relative abundance of 13 individuals for the 2015 Area 1/2 location J_T6+00E60 is probably a result of patchiness as the diversity reported is relatively high. The PAH concentrations are low, and the SEM/AVS ratio is less than 1, indicating that metals are not bioavailable. Therefore contamination does not seem to be the cause for the low abundance.

Patchiness is a common occurrence in benthic macroinvertebrate distribution which makes determining trends with small numbers of samples difficult (Elliott, 1983). The worms, mollusks, and crustaceans that dominate the fauna at Pine Street are not extremely mobile, so the populations tend to expand spatially around the early colonizers creating a "patch". Random sampling may hit a patch or miss one. As the populations expand, the distance between "patches" would decrease, so in ideal conditions over the long term the populations would become uniformly distributed across an area. However, population expansion may be limited by predation, availability of food resources, or other natural or man-made stressors. Also, in newly colonized environments, such as the capped area of the Canal, the spatial heterogeneity may result because not enough time has elapsed for the benthic macroinvertebrates to fully utilize the available habitat. The insect larvae like the chironomid midges would be expected to become widely distributed more rapidly, given suitable substrate conditions, because the next generation is produced from eggs laid by the flying adult. Chironomid larvae were reported in all three Area 1 replicates.

The Area average 0-10 cm surface sediments sum-of-PAH concentrations reported from the cap coring in Areas 8 and 1 in 2015 (see Section 4.3.1 and Table 4-3) were less than 2 mg/kg, well below the 21 mg/kg benchmark value (although that concentration is only an applicable benchmark value for the mid-cap samples according to the CMWP). The average summed PAH concentrations in the Areas 8 and 1 shallow sediment samples were well below the Area 4/5 16.61 mg/kg average (see Table 4-3). As discussed above, the high organic carbon content of the sediments in Area 4/5 limits the bioavailability of PAHs. The SEM/AVS ratio for Area 4/5 was 0.175 at sample location J_T21+00E50 in Area 4/5 which is well below 1, which indicates that metals at this location are not bioavailable.

The Performance Standard for benthic macroinvertebrates is: "*Presence of a macrobenthic invertebrate community consistent with sediment type, grain size, water depth, and total organic carbon content of sediments after three years*." (Ref. SOW VII. H. 1.) The 2005, Year 3, sampling in Areas 1, 4/5, and 8 showed the presence of a benthic macroinvertebrate community consistent with the sediment type. Monitoring continues to show development of the

benthic macroinvertebrate community. Thus, the Performance Standard for these Areas has been met over the last 10 years.

4.5.2 Aquatic Vegetation Monitoring

4.5.2.1 Qualitative Vegetation Monitoring

Monitoring of Canal submergent vegetation was performed during the macroinvertebrate sampling on September 22 and 23, 2015. On those days, the Lake level was lower than the weir crest and the Canal water level stage. See Figure 2-5 for location of the areas described below. The results of this monitoring are as follows.

Areas 8 and 1 – Turning Basin and Northern Portion of the Canal

Areas 8 and 1 are the deeper areas of the Canal and Turning Basin. The sampling station in Area 8, the Turning Basin, was very close to the northwest corner of the Turning basin. Water depth at the macroinvertebrate sampling station was 2.0 feet. Broadleaved cattail (*Typha latifolia*), burreed (*Sparganium eurycarpum*), and flowering rush (*Butomus umbellatus*) were observed on the shore. Common reed (*Phragmites australis*) was also present on the shore. White water lily beds (*Nymphaea odorata*) were the dominant floating leaved plant. Eurasian milfoil (*Myriophyllum spicatum*) formed the dominant submergent vegetation in the Turning Basin. Filamentous green algae were prominent on the submerged vegetation and floccular brown algae were also present on the rooted plants in both Area 8 and Area 1. In Area 1, the rooted aquatic vegetation noted included Eurasian milfoil, and white water lily. Burreed, cattail, and flowering rush were also present on the shore of Area 1. In both areas, the water was turbid and suspended green algae appeared to be a significant component of the turbidity.

Area 2 Southern Canal

The Amended Cap was placed in this area in 2010. The Amended Cap consists of a sand layer covered by a RCM, with a TRM mat as the final surface. This TRM mat consists of a plastic enmeshed in a chain-link wire framework.

The TRM extends into the riparian area above the mean water level for the Canal. On the east side of the Canal, an area of soil from 8 to 12 feet wide exists between the termination of the

TRM and an access road to the NAPL recovery wells. The restoration seeding of this area completed in 2013 has resulted in thick vegetative cover (see the report on compensatory restoration in Appendix 9 for a full discussion). The TRM and the area between the TRM and the access road have been maintained to prevent the growth of woody vegetation.

The TRM at the edges of the Canal on both the east and west sides has been colonized by native plants and *Phragmites*. Eurasian milfoil and white waterlily have colonized the Amended Cap.

Area 2 Waterway

The bottom of the waterway in the southern half of Area 2 is stabilized with rock gabions and the waterway channel formed using coir logs. These coir logs have been fully overgrown by emergent vegetation including burred and cattail. The waterway also supports a thick growth of waterweed and Eurasian milfoil that fills the channel.

Area 3

Phragmites has become dominant in all but the wettest portion of Area 3. Broadleaved cattail dominates the wetter areas. Wetland vegetation monitoring is no longer required in this area because the required wetland monitoring to demonstrate ≥50% dominance of wetland vegetation was completed in Year 5 following capping, as required by the Statement of Work.

Area 7

Cattail and *Phragmites* are the dominant emergent wetland plants in Area 7. The black locust trees that have colonized the Site have become quite large. The alders that were planted at the south west side of the area continue to thrive. Wetland vegetation monitoring is no longer required in this area because the required wetland monitoring to demonstrate ≥50% dominance of wetland vegetation was completed in Year 5 following capping, as required by the Statement of Work.

100 ft. X 100 ft. Area

The 100 ft. x 100 ft. Area is located in the wetland area south of the turning basin and

east of Area 1 (See Figure 2-5) *Phragmites* is the dominant plant in the 100 ft. X 100 ft. Area. Two small silver maple trees were noted above the *Phragmites*.

West Bank Cap

Wetland vegetation monitoring is no longer required in this area because the required wetland monitoring to demonstrate ≥50% dominance of wetland vegetation was completed in Year 5 following capping, as required by the Statement of Work.

Much of the West Bank Cap area was cleared for the construction of the Amended Cap. The TRM has been anchored in a trench there. The northernmost section of the TRM is anchored by concrete poured into the trench. The remainder of the trench is earth filled. On September 22 and 23, 2015, the West Bank Cap, including the area impacted by the Amended Cap construction, was dominated by *Phragmites*, despite herbicide treatment in 2013.

4.5.2.2 Compliance with Performance Standards

Wetland restoration in the West Bank Cap area has met the Performance Standards for wetland vegetation specified in the SOW for the fifth growing season post-construction:

- *Plant community >50% of dominant wetland plants are wetland indicators* (Ref. SOW VII H.2 and H.3)

The Performance Standard for Palustrine Open Water vegetation has also been met because submergent vegetation is present in Areas 8, 1, 2, and 4 (See Figure 2-5):

- *Presence of submergent vegetation* (Ref. SOW VII. H.1.)

4.5.3 Wetlands Areas 3 and 7

Soil sampling in 2013 (Year 10 post-construction) showed that the soils in Areas 3 and 7 showed soil morphologies for hydric soils. Based on the soil profiles, hydric soil morphology has developed in the palustrine emergent portions of Areas 3 and 7, and the scrub-shrub portion of Area 3 (See Figure 2-5); thus satisfying the final performance standard for the wetland restoration:

- *Soils show a trend toward hydric conditions (morphologies) at close of year 10 [2013]*. (Ref. SOW, VII.H. 2 and 3)

U = Sample was analyzed for the constituent, but it was not detected in the sample

J – Sample was analyzed for the constituent, value is estimated due to insufficient accuracy and or reproducibility

UJ – Sample was analyzed for the constituent but not detected, value is estimated due to insufficient accuracy and or reproducibility

NA = Non analyzed

[1] Using current Sample Point designation convention, this location would be J_T23+70E10

[2] Not available due to non-detect result for AVS

4.6 OUTLET WEIR INSPECTION

The outlet weir was inspected on August 26, 2015. The inspection field form is provided in Appendix 1. No visual evidence of settlement of either the weir or the railroad bridge was observed. The concrete of the weir was in good condition, with no cracks, exposed rebar or scaling noted. Some 1/2 to 1-inch pits were noted in the concrete (see photos in Appendix 7). As has been common, large portions of the weir and the adjacent rip-rap were covered with sand, and therefore were not inspected. The sand has accumulated to approximately 0.2 feet below the top of the weir crest and spillway on the upstream (Canal) side of the weir, and to approximately 0.8 feet below the crest on the Lake side. The rip rap was visible to the north and south of the weir abutments, and had no evidence of erosion. The elevations and alignment of the railroad bridge concrete abutments and weir remain essentially unchanged. The railroad bridge abutments surveyed in 2015 were within 0.02 feet of the 2014 measurements, and within 0.05 feet of the initial elevations surveyed in 2001. The elevations of the weir measured in 2015 were within 0.03-0.06 feet and lower than those surveyed in 2014 and 2001. The outlet weir, adjacent rip-rap, and railroad abutments are all stable and have held up well to the test of weather and seasonal changes over the past 14 years.

4.7 SEDIMENT TRANSPORT MONITORING

There were no storms of sufficient intensity to trigger the stormwater system, when the elevation of the lake was below the weir, during the 2015 monitoring season (April 15th to November 25th). However, due to unseasonably high rainfall amounts in late May and early June, the canal gradually rose above the elevation trigger point of 97.55 ft. (NAVD88) by June 12th, which triggered the automated ISCO sampler to activate the sampling routine. At this time, the elevation of the lake was also above the weir, so the samples were discarded because they would not be representative of water flowing from the canal to the lake.

Pursuant to the CMWP, the stormwater trigger elevation will remain at 97.55 ft. NAVD88 since low level PAHs were detected in surface water samples collected during the two storms in 2013 that exceeded that trigger elevation.

4.8 COMPENSATION RESTORATION MONITORING RESULTS

Two monitoring events of the post-Amended Cap remediation wetlands restoration were conducted at the Pine Street Canal Site; on June 10, 2015 and September 24, 2015. Monitoring of the off-site restoration area at the Ethan Allen Homestead was conducted on June 11, 2015. The monitoring report is attached as Appendix 9. The two on-site monitoring quadrants, North Area Plot and South Area Plot, had 100% survival, and all of the plantings outside the monitoring plots survived. The June 11, 2015 inspection was the third monitoring event for the Ethan Allen Homestead buffer planting and the survival rate was 48%. The 50 surviving trees are sufficient for the desired tree density at the Ethan Allen Homestead and achieve the objective in the Restoration Plan for Mitigation of Habitat Loss Due to Installation of the Amended Cap (The Johnson Company, 2012). Based on the success of the restoration at the two sites, continued monitoring is no longer necessary.

NOTES:

The settlement plates are 2-foot square aluminum plates that include an inverted cone on top of a 1-foot long pipe to assist surveying. The difference in elevation between the cone/pipe and the plate itself is 1.1 feet.

The 2011-2015 surveys were completed by surveying the plate itself. Although considerable effort was made to place the survey rod in the center of the plates, the precise location of the survey rod on the plate is uncertain. Therefore, a potential horizontal error of +/- two feet exists for each plate in each survey.

Data provided by Little River Survey in feet NAVD88. Settlement Plate Schematic from ARCADIS 03/22/2011 Construction Completion Report

NOTES:

1. BATHYMETRIC SURVEY DATA BY THE JOHNSON COMPANY, INC. – 2005.
2. VISUAL SHEEN MONITORING INCLUDES MONITORING FOR NAPL SEEPS, SHEEN, DROPLETS AND GANGLIA.
3. VISUAL CAP INSPECTION WILL BE CONDUCTED ON EACH BANK OF THE CANAL FROM TRANSECT T9+00 TO T12+50.
4. THE EXTENT OF AMENDED CAP IS SHOWN FOR THE AREA IN THE CANAL. THE GEOCOMPOSITE, RCMS, AND TRM EXTEND BEYOND THE CRIBBING AND TERMINATE ON THE BANKS.
5. LOCATION OF AMENDED CAP TERMINATION ON WEST BANK REPRESENTS THE EAST SIDE OF THE ANCHOR TRENCH (i.e. extent of exposed amended cap layers).
6. LOCATION OF AMENDED CAP TERMINATION ON EAST BANK REPRESENTS THE EXTENT OF THE TRM (TOP LAYER OF AMENDED CAP). THE TRM EXTENDS A MINIMUM OF 1 FOOT BEYOND THE EXTENT OF THE RCM LAYER. THE RCM LAYER EXTENDED BEYOND THE CRIBBING BASED ON FIELD VERIFICATION.

Subject: Pine Street Canal Site-Interim Report on the July 8-10, 2015 Amended Cap Monitoring Event

Thor:
Provided below is an interim report for the July 8-10, 2015 Pine Street Canal Site Amended Cap surface water and passive recovery well monitoring event.

Summary:

- Visual sheen monitoring was performed July 8-9, 2015.
- Measurements of depth to groundwater and NAPL thicknesses, and NAPL removal, were performed July 8-10, 2015.
- During the monitoring period, the canal and lake levels were the same at 97.73 ft. (NAVD88), which is above the weir outlet. The weather was mostly cloudy with periods of overcast and sun, 65-70 degrees, generally with 10-20 mph winds.
- The monthly cap inspection was performed July 8, 2015.

Sheen monitoring:
The water was light brown and translucent.
Bubbles were observed at a total of 30 locations. Of these, 12 bubble locations were observed outside the Amended Cap, 4 locations along the southern edge of the Cap, and 14 within the Amended Cap area. The Amended Cap extends from transects T9+00 (North) to T12+50 (South). The field forms are attached (071015 Sheen Monitoring Forms.pdf).

- No sheens were observed within the Amended Cap area.
- One sheen was observed outside the Amended Cap area- a 0.5 ft. sheen at T12+60 E55 (approximately ten feet south of southern edge of Amended Cap).
- No odors were noted along the shores of the Canal.

RW well monitoring:
A table containing the NAPL thicknesses and volume pumped is attached: (071315 Amended Cap RW NAPL measurement and removal summary.pdf)
No measureable LNAPL was present in the Amended Cap RW wells. DNAPL thicknesses in the wells were generally similar to those measured during the previous monitoring event in June 2015.

As usual, well RW-109 has the most DNAPL (22.1 feet) at approximately the same thickness (22.1 feet) as previously measured. The adjacent well, RW-108, initially had 2.7 feet of DNAPL, which is slightly lower than the previous monitoring event in June 2015 (3.5 ft. DNAPL) . Of the five wells on the West Bank, the center three wells, RW-102, -103 and -104 initially had between 3.4-5.1 feet of DNAPL; RW-101 on the north end had 0.2 feet and RW-105 on the south end had 0.4 feet. Pumping of RW-101 was not performed, as there was approximately a foot of water surrounding the well, creating a high risk of releases to surface water if NAPL pumping was attempted.

Approximately 165 gallons of DNAPL and associated water were pumped from the wells and stored onsite in drums and the totes located in the fenced storage area for transport and off-site disposal.

Cap Condition Evaluation:

- The edges of the amended cap were observed to be in good shape, with no new damage since the last inspection (June 2015).

The following wildlife was observed during the monitoring:
Red wing black birds
Mallards
Several fish surfacing
Gulls
Gold finches
Dragonflies
Water skippers

Subject: Pine Street Canal Site July 22, 2015 Sheen Monitoring Summary

Thor:

Provided below is an interim report for the July 22, 2015 Pine Street Canal Site Amended Cap surface water monitoring event.

The water level of Lake Champlain was 97.1 ft. and the Canal was 97.0 ft. (NAVD88); both are above the weir outlet. The weather was variable: 60 degrees F and raining in the morning, and sunny, 65-75 degrees F, with 10-15 mph winds in the afternoon. The water was light brown and murky to translucent. There were lily pads in bloom.

Sheen Monitoring Summary:
Visual sheen monitoring was performed on July 22nd.
A total of 66 bubble locations were observed: 26 outside the Amended Cap, 36 within the Amended Cap area, and 4 locations along the north and south edges of the Cap. The Amended Cap extends from transect T9+00 to T12+50. The field forms are attached (072215 Sheen Monitoring Forms.pdf).

- No sheens associated with bubbles were observed within the Amended Cap area.
- One sheen associated with bubbles was observed outside of the Amended Cap area, at T12+60 E45 (near the southern edge of the cap). See attached photo (072215_PSCS Sheen T12+60 E45).
- No odors were noted along the shores of the Canal within the Amended Cap area.

The following wild-life was observed during the monitoring:
green herons
many redwing black birds
tern
grackles
gulls
Canada geese
several surfacing fish, including swarms of minnows eating plant matter and creating bubbles
dragonflies

Subject: Pine Street Canal Site-Interim Report on the August 4-6, 2015 Amended Cap Monitoring Event

Thor:
Provided below is an interim report for the August 4-6, 2015 Pine Street Canal Site Amended Cap surface water and passive recovery well monitoring event.

Summary:

- Visual sheen monitoring was performed August 4-5, 2015.
- Measurements of depth to groundwater and NAPL thicknesses, and NAPL removal, were performed August 4-6, 2015.
- During the monitoring period, the canal level was 96.52 ft. and the lake level was 96.4 ft. (NAVD88), which is below the weir outlet. The weather was a mix of sun, clouds, and light rain, 70-80 degrees and humid, generally with 10-20 mph winds.
- The monthly cap inspection was performed August 6, 2015.

Sheen monitoring:
The water was light brown and translucent.
Bubbles were observed at a total of 41 locations. Of these, 16 bubble locations were observed outside the Amended Cap, 6 locations along the northern and southern edges of the Cap, and 19 within the Amended Cap area. The Amended Cap extends from transects T9+00 (North) to T12+50 (South). The field forms are attached (080415 Sheen Monitoring Forms.pdf).

- No sheens were observed within the Amended Cap area.
- Two sheens locations were observed outside the Amended Cap area- a 1 inch sheen at T8+10 E75 (approximately 90 feet north of northern edge of Amended Cap); and 1-2 inch sheens at T12+51 E45, along the southern edge of the Amended Cap (see attached photo: 080515 Sheen at T12+51 E45).
- No odors were noted along the shores of the Canal.

RW well monitoring:
A table containing the NAPL thicknesses and volume pumped is attached: (080615 Amended Cap RW NAPL measurement and removal summary.pdf)
No measureable LNAPL was present in the Amended Cap RW wells. DNAPL thicknesses in the wells were generally slightly higher than those measured during the previous monitoring event in July 2015.

As usual, well RW-109 has the most DNAPL (22.2 feet) at approximately the same thickness (22.1 feet) as previously measured. The adjacent well, RW-108, initially had 3.3 feet of DNAPL, which is slightly higher than the previous monitoring event in July 2015 (2.7 ft. DNAPL) . Of the five wells on the West Bank, the center three wells, RW-102, -

103 and -104 initially had between 3.2-5.3 feet of DNAPL; RW-101 on the north end had 0.8 feet and RW-105 on the south end had 0.2 feet.

Approximately 167 gallons of DNAPL and associated water were pumped from the wells and stored onsite in drums and the totes located in the fenced storage area for transport and off-site disposal.

Cap Condition Evaluation:

- The edges of the amended cap were observed to be in good shape, with no new damage since the last inspection (July 2015).

The next NAPL sheen inspection is scheduled for later this week (week of 8/17/15).

Subject: Pine Street Canal Site August 20, 2015 Sheen Monitoring Summary

Thor:

Provided below is an interim report for the August 20, 2015 Pine Street Canal Site Amended Cap surface water monitoring event.

The water level of Lake Champlain was 95.8 ft. and the Canal was 96.2 ft. (NAVD88). The weather was between 80 and 95 degrees, sunny and humid, with 10-20 mph southwest winds. The water was light brown and translucent with abundant lily pads and milfoil.

Sheen Monitoring Summary:
Visual sheen monitoring was performed on August 20th.
A total of 19 bubble locations were observed: 5 outside the Amended Cap, 11 within the Amended Cap area, and 3 locations along the north and south edges of the Cap. The Amended Cap extends from transect T9+00 to T12+50. The field forms are attached (082015 Sheen Monitoring Forms.pdf).

- No sheens associated with bubbles were observed within the Amended Cap area.
- Three sheens associated with bubbles were observed outside of the Amended Cap area: at T8+50 E5 there was an approximately one foot diameter sheen (50 ft. north of the northern edge of the Cap); at T12+50 E50 and T12+50 E60 there were continuous bubbles associated with sheens (near the southern edge of the cap).
- No odors were noted along the shores of the Canal within the Amended Cap area.

The following wild-life was observed during the monitoring:
4 otters
Cormorant
White egret
Green herons
Turtle surfacing
Gulls

Subject: Pine Street Canal Site-Interim Report on the September 1-3, 2015 Amended Cap Monitoring Event

Thor:
Provided below is an interim report for the September 1-3, 2015 Pine Street Canal Site Amended Cap surface water and passive recovery well monitoring event.

Summary:

- Visual sheen monitoring was performed September 2-3, 2015.
- Measurements of depth to groundwater and NAPL thicknesses, and NAPL removal, were performed September 1-3, 2015.
- During the monitoring period, the canal level was 96.1 ft. and the lake level was 95.1 ft. (NAVD88), which is below the weir outlet. The weather was a mix of sun, clouds, and light rain, 65-90 degrees and humid, generally with 5-10 mph winds.
- The monthly cap inspection was performed September 3, 2015.

Sheen monitoring:
The water was light brown and translucent.
Bubbles were observed at a total of 21 locations. Of these, 6 bubble locations were observed outside the Amended Cap and 15 within the Amended Cap area. The Amended Cap extends from transects T9+00 (North) to T12+50 (South). The field forms are attached (090115 Sheen Monitoring Forms.pdf).

- No sheens were observed within the Amended Cap area.
- Three areas with rainbow and/or blue sheens (without a clear source of bubbles) were observed trapped in the milfoil more than ten feet south of the Amended Cap area between T12+60 and T13+00. Bubbles associated with sheens were observed ten feet south of the Amended Cap at T12+60 East 50. A sharp tar odor was noted in the vicinity of these sheens south of the Amended Cap.
- One 0.1 ft. diameter sheen was observed 100 feet north of the Amended Cap, at T8+00 E10.

RW well monitoring:
A table containing the NAPL thicknesses and volume pumped is attached: (090315 Amended Cap RW NAPL measurement and removal summary.pdf)
No measureable LNAPL was present in the Amended Cap RW wells. DNAPL thicknesses in the wells were generally the greatest they have been since the first 2015 monitoring event in April.

As usual, well RW-109 had the most DNAPL (22.5 feet) which was 0.3 to 0.4 feet thicker than other measurements performed in 2015. The adjacent well, RW-108, initially had 3.8 feet of DNAPL, which is 0.5 feet more than the previous monitoring event in August 2015. Of the five wells on the West Bank, the center three wells, RW-102, -103 and -104 initially had between 7.1-9.3 feet of DNAPL (compared to 3.2-5.3 feet in August); RW-101 on the north end had 1.1 feet and RW-105 on the south end had less than 0.1 feet in September.

The dedicated PVC tubing in well RW-104 was compromised on the first day of monitoring; therefore NAPL removal was not possible. The tubing has been replaced and the well will be monitored and pumped (if necessary) at the next event in October. The dedicated suction fitting in RW-109 was compromised on the third (last) day of monitoring; therefore NAPL was not removed from this well on the third day. In both cases, the NAPL has impacted the plastic over time, and they will be replaced.

Approximately 146 gallons of DNAPL and associated water were pumped from the wells and stored onsite in drums and the totes located in the fenced storage area for transport and off-site disposal.

Cap Condition Evaluation:

- The edges of the amended cap were observed to be in good shape, with no new damage since the last inspection (August 2015).

Subject: Pine Street Canal Site September 16, 2015 Sheen Monitoring Summary

Thor:

Provided below is an interim report for the September 16, 2015 Pine Street Canal Site Amended Cap surface water monitoring event.

The water level of Lake Champlain was 95.7 ft. and the Canal was 96.3 ft. (NAVD88). The weather was between 65-80 degrees and sunny, with 5-10 mph southwest winds. The water was light brown and murky with abundant lily pads and milfoil.

Sheen Monitoring Summary:
Visual sheen monitoring was performed on September 16th.
A total of 10 bubble locations were observed: 6 outside the Amended Cap, 3 within the Amended Cap area, and 1 location along the southern edge of the Cap. The Amended Cap extends from transect T9+00 to T12+50. The field forms are attached (091615 Sheen Monitoring Forms.pdf).

- No sheens associated with bubbles were observed within the Amended Cap area.
- No sheens associated with bubbles were observed outside of the Amended Cap area, although residual sheen was observed along the southern edge of the Cap.
- No odors were noted along the shores of the Canal within the Amended Cap area.

The following wild-life was observed during the monitoring:
Cormorants
Turtles
Gulls
Dragonflies
Fish surfacing
Ducks
Monarch butterfly
Blue heron
Honey bees on lily pads
Kingfisher
Migrating geese

Thanks!

Thor:
Provided below is an interim report for the September 28-October 1, 2015 Pine Street Canal Site Amended Cap surface water and passive recovery well monitoring event, and the October 15th sheen monitoring event.

Summary:

- Visual sheen monitoring was performed September 28-October 1, and on October 15, 2015.
- Measurements of depth to groundwater and NAPL thicknesses, and NAPL removal, were performed September 29-October 1, 2015.
- During the September 28-October 1 monitoring period, the canal level ranged from 96.0-96.9 ft. and the lake level ranged from 94.1-94.5 ft. (NAVD88), which is below the weir outlet. The weather was a mix of sun and clouds, with heavy rain on September 30th, 55-70 degrees, generally with 5-10 mph winds. On October 15, 2015, the canal level was 96.2 ft. and the lake level was 94.8 ft.
- The monthly cap inspection was performed September 29 and October 1, 2015.

Sheen monitoring September 28-October 1:
The water was light brown and translucent to turbid, with abundant lily pads and milfoil.
Bubbles were observed at a total of 27 locations. Of these, 17 bubble locations were observed outside the Amended Cap, 9 within the Amended Cap area, and one along the southern edge of the Cap. The Amended Cap extends from transects T9+00 (North) to T12+50 (South). The field forms are attached (092915 Sheen Monitoring Forms.pdf).

- No sheens were observed within the Amended Cap area.
- Three bubble locations with associated 0.5-3.0 ft. sheens were observed south of the Amended Cap area between T12+55 and T12+80.

Sheen monitoring October 15:
The water was light brown and translucent; the lily pads and milfoil have died back considerably since the last monitoring event.
Bubbles were observed at a total of 14 locations. Of these, 2 bubble locations were observed outside the Amended Cap, 10 within the Amended Cap area, and 2 along the southern edge of the Cap. The field forms are attached (101515 Sheen Monitoring Forms.pdf).

- No sheens were observed within the Amended Cap area, nor with any bubble locations outside the Cap area.

RW well monitoring September 29-October 1:
A table containing the NAPL thicknesses and volume pumped is attached: (100115 Amended Cap

RW NAPL measurement and removal summary.pdf)
No measureable LNAPL was present in the Amended Cap RW wells. DNAPL thicknesses in the wells were generally the greatest they have been since the first 2015 monitoring event in April.

As usual, well RW-109 had the most DNAPL (22.3 feet). The adjacent well, RW-108, initially had 3.7 feet of DNAPL, similar to the previous monitoring event in early September 2015 (3.8 feet). Of the wells on the West Bank, the center three wells, RW-102, -103 and -104 initially had between 6.3-9.3 feet of DNAPL; RW-101 on the north end had 1.3 feet and RW-105 on the south end had less than 0.4 feet. RW-10+25 and RW-14 had 0.4 and 0.3 feet of DNAPL, respectively, which is the most they have had in many years; these typically have less than 0.1 feet of DNAPL and do not have to be pumped.

The dedicated pipe and suction fitting in RW-109 was replaced with iron pipe on September 28th, before the first day of monitoring.

Approximately 189 gallons of DNAPL and associated water were pumped from the wells and stored onsite in drums and the totes located in the fenced storage area for transport and off-site disposal.

Cap Condition Evaluation:

- The edges of the amended cap were observed to be in good shape, with no new damage since the last inspection (early September).

The following wildlife was observed during the monitoring events:

Turtle

Dragonflies

Gulls

Monarch butterflies

Crows

Small fish surfacing

Mallards

Cormorants

Woodpeckers

3-4 Otters

Redwing blackbirds

Kingfisher

Cardinals

Migrating geese

Great blue heron

Mink

Snake swimming

Subject: Pine Street Canal Site-Interim Report on the October 26-28, and November 13, 2015 Amended Cap Monitoring Events

Thor:
Provided below is an interim report for the October 26-28, 2015 Pine Street Canal Site Amended Cap surface water and passive recovery well monitoring event, and the November 13th sheen monitoring event.

Summary:

- Visual sheen monitoring was performed October 26-28, and on November 13, 2015.
- Measurements of depth to groundwater and NAPL thicknesses, and NAPL removal, were performed October 26-28, 2015.
- During the October 26-28 monitoring period, the canal level was 96.2 ft. and the lake level was 94.0 ft. (NAVD88), which is below the weir outlet. The weather during the October event was a mix of sun and clouds, 45 degrees, generally with 5-10 mph winds. On November 13, 2015, the canal level was 96.4 ft. and the lake level was 94.3 ft. The weather on November 13th was overcast and 50 degrees.
- The monthly cap inspection was performed October 26, 2015.

Sheen monitoring October 26-28th:
The water was light brown and translucent.
Bubbles were observed at a total of 13 locations. Of these, 4 bubble locations were observed outside the Amended Cap, 8 within the Amended Cap area, and one along the southern edge of the Cap. The Amended Cap extends from transects T9+00 (North) to T12+50 (South). The field forms are attached (102815 surface water-sheen-bubble forms.pdf).

- No sheens were observed within the Amended Cap area, nor with any bubble locations outside the Cap area.

Sheen monitoring November 13th:
The water was light brown and translucent.
Bubbles were observed at a total of 54 locations. Of these, 21 bubble locations were observed outside the Amended Cap, 28 within the Amended Cap area, and 5 along the southern edge of the Cap. The field forms are attached (111315 Sheen Monitoring Forms.pdf).

- No sheens were observed within the Amended Cap area, nor with any bubble locations outside the Cap area.

RW well monitoring October 26-28th:
A table containing the NAPL thicknesses and volume pumped is attached: (102815 Amended Cap RW NAPL measurement and removal summary.pdf).
No measureable LNAPL was present in the Amended Cap RW wells. DNAPL thicknesses in the wells were generally lower than the previous monitoring event (September).

As usual, well RW-109 had the most DNAPL (22.0 feet). The adjacent well, RW-108, initially had 3.6 feet of DNAPL, similar to the previous monitoring event in late September 2015 (3.7 feet). Of the wells on the West Bank, the center three wells, RW-102, -103 and -104 initially had between 2.3-4.5 feet of DNAPL, compared to 6.3-9.3 feet in September; RW-101 on the north end had 1.0 feet and RW-105 on the south end had 0.5 feet of DNAPL. RW-9+80, RW-10+25, RW-11 and RW-14 all had less than 0.1 feet of DNAPL and did not need to be pumped.

Approximately 213 gallons of DNAPL and associated water were pumped from the wells and stored onsite in drums and the totes located in the fenced storage area for transport and off-site disposal.

Cap Condition Evaluation:

- The edges of the amended cap were observed to be in good shape, with no new damage since the last inspection (late September).

The following wildlife was observed during the monitoring events:

Blue jays

Cormorant

Gulls

Mallards

Pair of Blue Herons

4 Ducks

Hairy woodpecker

Crows

Subject: Pine Street Canal Site-Interim Report on the November 23-25, 2015 Amended Cap Monitoring Event

Thor:
Provided below is an interim report for the November 23-25, 2015 Pine Street Canal Site Amended Cap surface water and passive recovery well monitoring event.

Summary:

- Visual sheen monitoring was performed November 23-24, 2015.
- Measurements of depth to groundwater and NAPL thicknesses, and NAPL removal, were performed November 23-25, 2015.
- During the monitoring period, the canal level was between 96.18 ft. and 96.23 ft. and the lake level was on average 94.5 ft. (NAVD88), which is below the weir outlet. The weather during the event was a mix of sun and snow flurries, 25-45 degrees, generally with 5-10 mph winds.
- The monthly cap inspection was performed November 25, 2015.
- Ice was beginning to form on sections of the canal, so this was the last surface water and passive recovery well monitoring event until the ice clears in spring 2016, and the Site has been buttoned up for winter. NAPL containers were removed from the Site by ENPRO on December 4, 2015.
- The storm water system has been disassembled for the winter.

Sheen monitoring:
The water was light brown and translucent with no noticeable NAPL odors. Ice had formed over the following sections of the canal, and therefore sheen monitoring was not feasible in these areas: along the western bank from T8+00 to T8+50; the entire width of the canal from T11+00 to T13+00. The Amended Cap extends from transects T9+00 (North) to T12+50 (South).
Bubbles were observed at a total of 3 locations. All 3 bubble locations were observed outside the Amended Cap. The field forms are attached (112515 Sheen Monitoring Forms.pdf).

- No sheens were observed within the Amended Cap area, nor with any bubble locations outside the Cap area.

RW well monitoring:
A table containing the NAPL thicknesses and volume pumped is attached: (112515 Amended Cap RW NAPL measurement and removal summary.pdf).

No measureable LNAPL was present in the Amended Cap RW wells. DNAPL thicknesses in the wells were generally slightly higher than the previous monitoring event (October), but approximately equal to the averages in 2015.

As usual, well RW-109 had the most DNAPL (22.2 feet). The adjacent well, RW-108, initially had 4.3 feet of DNAPL, slightly higher than the previous monitoring event in late October 2015 (3.6 feet). Of the wells on the West Bank, the center three wells, RW-102, -103 and -104 initially had between 3.8-5.0 feet of DNAPL, compared to 2.3-4.5 feet in October; RW-101 on the north end initially had 0.8 feet and RW-105 on the south end had 0.3 feet of DNAPL. RW-106, RW-107, RW-110, RW-9+80, RW-10+25, RW-11 and RW-14 all had less than 0.1 feet of DNAPL and did not need to be pumped.

Approximately 195 gallons of DNAPL and associated water were pumped from the wells and stored onsite in drums and the totes located in the fenced storage area for transport and off-site disposal.

Cap Condition Evaluation:

- The edges of the amended cap were observed to be in good shape, with no new damage since the last inspection (late October).

The following wildlife was observed during the monitoring events:

Gulls

Mallards

Blue heron

Kingfishers

PINE STREET CANAL SUPERFUND SITE
OUTLET WEIR INSPECTION FORM

Date: 8-26-15 Time: 12:33 Weather: 75° sunny, calm

Inspector (Print Name): DMAYNARD Signature: _____

I. Mouth of Weir

Accumulation of debris or beaver activity: NONE

Condition of stoplogs: GOOD

Water surface differential: 0.23' B. crest (canal) 0.83 FB crest (TRIB. TO LAKE)

II. Ends of Weir

Evidence of scour along the edges of the Canal near the ends of the weir:

NO

III. Base of Weir

Rip-rap in place: Yes on 9/26 Buried in Sand.

Scouring along the base: NO (buried in Sand)

IV. Condition of Concrete

Exposure of Rebar: No exposed rebar

Cracks, spalls, scaling: NO cracks - some ½-1" pitting

V. Overall Alignment

BS: SW corner = 1.70 1.70 + 100.15 = 101.85 > IR = 101.85

NW corner = ~~1.75~~ 1.74 + 100.14 = 101.88

Settlement:

RDP 8-26-15 -5.42 +101.85 = ~~96.23~~ 96.43 on 8-26

Init Elev

96.48	Sluice crest elevation:	BM-C	3.93 = 97.92
97.98	North weir abutment:	BM-B	3.91 = 97.94
97.97	South weir abutment:	BM-A	

VI. Railroad Bridge Abutments Elevation Check

100.12	Northeast	100.15	8.74
100.12	Northwest	100.14	8.75
100.18	Southeast	108.89	5.25
	Southwest	100.15	7.74

BM PIN ELEV. 103.64 FT NGVD

VII. Notes:

BM 5.25 on closed loop

Notes: C = casing
J = estimated
Water Depths listed as 0.00 indicate that the well was overflowing at the time of measurement.

APPENDIX 3

SUMMARY OF ALL ANALYTICAL DATA AND GROUNDWATER FIELD DATA

- **Summary of Field Groundwater Purge Data**
- **Summary of NAPL Measurements in Monitoring Wells 2000-2015**
- **Summary of Surface Water Analytical Data: PAHs**
- **Summary of Cap Coring Analytical Results: PAHs**
- **Summary of Cap Coring Analytical Results: Metals**
- **Biological Sample Summary**
    - **AVS/SEM Data**
    - **Summary of TOC Data**
    - **Summary of Taxonomy Data**
- **Summary of Groundwater Analytical Data: VOC's**
- **Summary of Groundwater Analytical Data: PAHs**
- **Summary of Groundwater Analytical Data: Metals**

						11/14/2001	flowing	Sheen	Present	6.2	Small black/brown product globs in bailer and on ends of bailer and marker, but no measurable product. Product stains and odor on sorbent.
						10/30/2002	flowing	Sheen	0.01-0.02	0.0	Product on tip of probe. Slight odor. Product stains on sorbent and bailer tips.
						10/15/2003	flowing	Sheen	<0.05	0.0	1/4" diameter brown tar blobs on tip of probe, sorbent and bailer. Slight odor.
						10/14/2004	flowing	Sheen	<0.1	0.0	Gray silty sand w/ tiny specs of brown DNAPL on bottom 0.01' of probe. Bottom 0.1' of bailer and sorbent has few 1/16" specks of DNAPL and slight odor.
						10/20/2005	flowing	Sheen	0.02-0.05	0.0	Specks of brown DNAPL and silt on tip of water marker. No measurable product. 0.02-0.05' DNAPL smeared on tip of bailer and sorbent. Slight sheen and odor on bailed water
						10/25/2006	flowing	Sheen	0.0	0.0	Black thick tar-like DNAPL on tip of water marker (0.04'). Minor smudges of DNAPL and minor sheens on bottom of bailer and sorbent. Slight product odor on purge water
						10/17/2007	flowing	Sheen	~0.02	0.0	Black thick tar-like DNAPL on tip of water marker (~0.02'). Minor smudges of DNAPL and minor sheens on bottom of bailer and sorbent. Slight product odor on purge water.
						10/9/2008	flowing	Sheen	Present	0.0	Black thick tar-like DNAPL on tip of water marker (two small pin-head sized specs). No NAPL on bottom of bailer or sorbent. Slight product odor on purge water.
						10/22/2009	flowing	Sheen	<0.1	0.0	~0.05' thick black DNAPL specs mixed with gray sediment on tip of water marder. No NAPL on bailer or sorbent.
						10/14/2010	flowing	0.0	<0.1	0.0	Few pinhead sized specs of DNAPL on tip of water marker. No NAPL on bailer or sorbent
						10/20/2011	flowing	0.0	<0.1	0.0	Few pinhead sized specs of DNAPL on tip of water marker. No NAPL on bailer or sorbent.
						11/16/2012	flowing	0.0	<0.1	0.0	Few pinhead specs of DNAPL on tip of water marker. Trace NAPL on bailer and sorbent.
						10/14/2013	flowing	0.0	<0.1	NM	No DNAPL per interface probe; 1/4 inch DNAPL on probe tip.
						10/22/2014	flowing	0.0	0.0	0.0	Sheen off probe tip, coal tar odor.
						10/5/2015	flowing	0.0	<0.1	0.0	NAPL droplets on lower 1/4 inch of probe tip

Summary of Non-Aqueous Phase Liquid Measurements in Monitoring Wells 2000-2015											
Well	Construction		Well Installation			Non-Aqueous Phase Liquid (NAPL) Measurements					
	Depth (fbgs)	Diam. (in.)	Installer	Date	Method	Date	Water Level (ftbtoc)	LNAPL (ft.)	DNAPL (ft.)	Max PID (ppmv)	Notes:
6_MW-17	25	2	M & E	10/30/1990	Auger	5/16/2001	0.66	Sheen	0.5	60.0	Black/brown product on sorbent and on bailer with strong odor
						11/14/2001	7.01	Sheen	Present	31.6	Many black product globs in bailer and on ends of bailer and probe, but no measurable product Product stains and strong odor on sorbent and on well casing.
						4/17/2002	3.63	film	0.3	19.1	DNAPL on bailer, probe and sorbent. 10-15 ml DNAPL removed by bailer
						10/30/2002	8.29	Sheen	0.5	0.2	~0.5 ft dark brown tar-like DNAPL by IF probe, bailer and sorbent. ~270 ml DNAPL with tar-like odor removed by peri-pump. Stains on probe after, but no measurable NAPL.
						4/16/2003	6.31	Sheen	0.1	0.2	~0.1 ft dark brown tar-like DNAPL/gray fine sand mix by probe, bailer and sorbent
						10/15/2003	5.58	0.0	0.1	2.3	0.1 ft DNAPL on bailer & sorbent. 0.04' DNAPL in bailer. 0.2' DNAPL on parts of probe.
						4/20/2004	3.05	Sheen	<0.1	1.1	0.05' brown tar-like DNAPL on bailer tip & sorbent. 0.06-0.08 ft. DNAPL on interface probe tip.
						10/14/2004	4.96	Sheen	<0.1	0.0	0.05-0.07 ft. brown tar-like DNAPL on bailer and sorbent. 0.05-0.08' DNAPL on probe.
						4/27/2005	2.55	Sheen	0.1	0.0	0.13' brown tar-like DNAPL on probe and bailer. Swabbed out NAPL with sorbent until no measurable NAPL remained.
						10/20/2005	4.42	Sheen	0.05-0.08	0.0	0.08' brown tar-like DNAPL on probe tip with 0.15' DNAPL smeared on probe. Sheen on water. 0.05' of DNAPL on bailer with DNAPL specks in bail water. 0.05' brown DNAPL on sorbent with sheens/smearing to 0.15' and three 1/2" blotches of DNAPL on side of sorbent
						4/11/2006	3.99	Sheen	<0.1	0.0	Brown tar-like DNAPL smeared on probe tip, sorbent and tip of bailer but no measurable DNAPL. Sheens and small (<1/8") blobs of LNAPL floating in bail water
						10/24/2006	4.84	Sheen	0.1	4.8	0.05' brown tar-like DNAPL on bailer with 0.23' DNAPL smeared on portions of probe tip. Sheen on bail water. 0.05' DNAPL smeared on tip of bailer and sorbent.
						4/19/2007	1.42	Sheen	<0.1	0.0	~0.1' brown tar-like DNAPL smeared on portions of IF probe tip. Sheen on bail water. ~0.05' DNAPL smeared on tip and sorbent.
						10/17/2007	5.10	Sheen	<0.1	0.2	~0.2' brown tar-like DNAPL smeared on portions of IF probe tip. Sheen on bail water. ~0.08' DNAPL smeared on bailer tip and sorbent.
						4/24/2008	0.63	Sheen	0.0	0.0	Brown tar-like NAPL smeared on bottom 0.05' of probe. Similar smearing on bailer and sorbent Sheen/NAPL odor on bail water.
						10/9/2008	4.65	Sheen	1.1	71.0	~1.1' brown DNAPL (No LNAPL), removed with Bailer. Total NAPL removed ~0.8L along with 2.5L water/NAPL mix. After bailing (4 times) <0.1' NAPL remained in well
						3/26/2009	4.16	0.0	1.1	116.0	1.13' DNAPL in well (No LNAPL), removed with bailer. Total NAPL removed ~0.25 gallons + ~1.25 gallons water/NAPL mix. <0.1' DNAPL present 1 hour after bailing
						4/22/2009	3.51	0.0	0.4	101.0	5.25 inches DNAPL in well, removed with peri-pump. Total NAPL removed ~400 ml along with ~0.5 gallons NAPL/water mix. No NAPL recovery after 18 hours
						5/18/2009	3.91	0.0	0.1	109.0	1.5 inches DNAPL in bottom of well, No NAPL removal attempted.
						6/10/2009	3.76	0.0	0.1	60.0	1.25 inches DNAPL in bottom of well, No NAPL removal attempted.
						7/15/2009	4.38	0.0	0.2	96.2	0.2 feet DNAPL in bottom of well, NAPL removed with peri-pump. Total NAPL removed ~200 ml along with 1 liter water/NAPL mix. No NAPL recovery after ~18 hours.
						8/13/2009	3.51	0.0	<0.1	57.4	<0.1 feet DNAPL smear on probe. ~3/4 inches DNAPL on steel tape, No NAPL removal.
						9/8/2009	5.03	0.0	0.1	98.1	1.25" DNAPL, ~50 ml NAPL & ~250 ml NAPL/water mix removed. No NAPL after 20 hours.
						10/22/2009	4.98	0.0	0.3	126.2	~4" DNAPL, ~200 ml NAPL removed & 2 Liters NAPL/water mix. No NAPL after 18 hours.
						4/21/2010	2.80	0.0	1.0	NM	~1 ft. DNAPL, 1 L NAPL removed & 1 Liter NAPL/water mix. No NAPL after 1 hour.
						10/14/2010	4.59	0.0	0.9	2.8	0.9 ft. DNAPL, 0.5 L NAPL removed & 1 Liter NAPL/water mix. No NAPL after 1 hour.
						4/26/2011	0.24	0.0	0.7	NM	0.7 feet of DNAPL in well, Due to high lake/canal level no NAPL removal performed.
						10/18/2011	3.65	0.0	1.3	38.3	1.3 feet of DNAPL in well, 1.0 L NAPL removed along with ~6.5 L of NAPL/water mix.
						5/4/2012	2.78	0.0	0.8	NM	0.8 feet of DNAPL in well, 1.0 L NAPL removed along with ~2 L of NAPL/water mix.
						11/16/2012	5.42	0.0	1.0	35.0	1.0 feet of DNAPL in well, 0.6 L NAPL removed along with ~5 L of NAPL/water mix.
						4/11/2013	4.93	0.0	0.5	NM	0.5 ft. DNAPL in well (no LNAPL). 1.0 Liter NAPL and 1.5 Liter NAPL/Water mix removed.
						10/15/2013	5.60	0.0	1.1	46.0	0.7 ft. DNAPL per interface probe, 1.1 ft. on probe tape (no LNAPL). 0.5 Liter NAPL removed. No NAPL in well after removal.
						5/15/2014	2.18	0.0	1.5	NM	0.8 ft DNAPL per interface probe, 1.5 ft on probe tape. 0.5L DNAPL removed. No NAPL in well after removal.
						10/23/2014	7.50	0.0	0.1	15.2	0.1 ft DNAPL per interface probe. 4.0 L water/NAPL mix removed. No NAPL in well after removal.
						5/7/2015	4.14	0.0	0.1	NM	0.1 ft DNAPL per interface probe. 0.1 L NAPL removed. No NAPL in well after removal.
						10/5/2015	5.20	<0.01	0.2	31.0	Sheen on water surface. 0.15 ft DNAPL per interface probe, 0.1 ft. on bailer. 0.04 L NAPL removed. 3/4 inch NAPL after bailing.

						7/14/2009	6.92	0.0	0.0	0.0	No evidence of NAPL on Water Level Tape or steel measuring tape
						8/13/2009	6.93	0.0	0.0	0.6	No evidence of NAPL on Water Level Tape or steel measuring tape
						9/8/2009	7.75	0.0	0.0	0.4	No evidence of NAPL on Water Level Tape or steel measuring tape
						10/22/2009	8.02	0.0	0.0	0.0	No evidence of NAPL on Water Level Tape or steel measuring tape
						4/21/2010	5.44	0.0	0.0	0.2	No evidence of NAPL on Interface Probe or steel measuring tape
						10/14/2010	7.30	0.0	0.0	0.0	No evidence of NAPL on Interface Probe or steel measuring tape
						4/26/2011	3.27	0.0	0.0	0.0	No evidence of NAPL on Interface Probe or steel measuring tape
						10/19/2011	6.30	0.0	0.0	0.1	No evidence of NAPL on Interface Probe or steel measuring tape
						5/4/2012	7.25	0.0	0.0	0.0	No evidence of NAPL on Interface Probe or steel measuring tape
						11/16/2012	8.13	0.0	0.5	0.0	0.5 feet DNAPL in bottom of well (no LNAPL). ~1.1 L NAPL and ~0.78 Liter NAPL/Water mix removed with peristaltic pump.
						4/11/2013	7.75	0.0	0.0	0.0	No evidence of NAPL with interface probe, steel tape or bailer
						10/15/2013	8.50	0.0	0.8	28.0	0.75 ft. DNAPL per interface probe, 0.8' on probe tape. 0.5 L. DNAPL removed. 0.05' DNAPL remaining after pumping.
						4/14/2014	0.71	<0.01	NM	NM	Frozen. Brown NAPL on interface probe.
						5/15/2014	4.80	film	0.8	NM	0.76 ft. DNAPL per interface probe, 1.5 ft DNAPL on probe/tape. 0.4L DNAPL removed. 0.06' DNAPL remaining after pumping.
						6/11/2014	6.34	0.0	Present	NM	Brown NAPL on interface probe. No measureable LNAPL.
						7/8/2014	6.85	0.0	NM	NM	No evidence of LNAPL with interface probe.

Summary of Non-Aqueous Phase Liquid Measurements in Monitoring Wells 2000-2015												
Well	Construction		Well Installation			Non-Aqueous Phase Liquid (NAPL) Measurements						
	Depth (fbgs)	Diam. (in.)	Installer	Date	Method	Date	Water Level (ftbtoc)	LNAPL (ft.)	DNAPL (ft.)	Max PID (ppmv)	Notes:	
						8/5/2014	7.53	0.0	NM	NM	No measureable LNAPL	
						9/3/2014	7.84	0.0	NM	NM	Brown NAPL on interface probe tip. No measureable LNAPL	
						10/1/2014	8.14	0.0	NM	NM	No evidence of LNAPL with interface probe.	
						10/23/2014	7.99	0.0	0.9	37.6	0.9 ft. DNAPL per interface probe. 0.5 L DNAPL removed, <0.5 L water removed. 0.3' DNAPL remaining after pumping.	
						1/21/2015	7.61	film	0.7	52.9	0.7 FT. DNAPL per interface probe	
						5/7/2015	6.52	0.0	1.4	NM	1.4 ft. DNAPL per interface probe. 0.5L DNAPL-water mix removed.	
						10/5/2015	7.87	<0.01	0.7	44.0	0.71 ft. DNAPL per steel tape. 0.5L DNAPL and 0.7L mixed water/NAPL removed. <0.02 ft. remaining.	
J_MW-23B	32	2	JCO	6/10/2000	Auger	7/12/2000	6.97	0.0	0.0	0.9	No product on sorbents, probe, or bailer	
						4/16/2002	5.95	NM	1.9	NM	Pulled bladder pump. Brown NAPL on pump. Interface probe indicates DNAPL from 28.34 30.19 fbtoc, and water from 30.19-30.8'.	
						4/17/2002	5.71	film	NM	14.2	Removed ~1.1 liters DNAPL with peristaltic pump. Sorbent afterwards showed ~0.15' DNAPL, and entire casing smeared with NAPL.	
						10/30/2002	9.77	Sheen	1.2	0.4	1.2 feet DNAPL by IF probe. Bailer and sorbent not used to avoid smearing NAPL on casing. ~650 ml DNAPL removed by peristaltic pump.	
						4/16/2003	5.80	Sheen	<0.1	1.4	<0.1' DNAPL on probe, bailer, and sorbent.	
						10/15/2003	8.15	0.0	0.2	1.3	~1.2' sediment mixed with DNAPL blobs in bottom of well based on total depth and bailer. Lower 1' of probe smeared with DNAPL. DNAPL smear on lower 0.15' of sorbent and present in 1/2" blobs over all of sorbent.	
						4/20/2004	5.08	0.0	<0.1	0.9	0.6' sediment mixed with tiny DNAPL blobs in bottom of well based on total depth and bailer. Lower 0.1' of probe smeared with DNAPL.	
						10/14/2004	7.20	film	<0.1	2.2	0.05-0.1' brown tar-like DNAPL on tip of probe. 0.05' DNAPL smeared on bailer. 0.08' DNAPL smeared on sorbent.	
						4/27/2005	4.55	Sheen	<0.1	3.7	0.05-0.08' brown tar-like DNPAL on probe. 0.1' DNAPL smeared on bailer. 0.02' DNAPL smeared on sorbent.	
						10/20/2005	6.52	Sheen	Present	0.1	Brown tar-like DNAPL on tip of probe, bailer and sorbent. Slight odor on bail water. Specs of NAPL on sides of bailer and sorbent, and two 1/2" blotches on side of sorbent	
						4/11/2006	6.05	0.0	Present	0.0	Brown tar-like DNAPL on tip of probe, bailer and sorbent. No mearsurable quantity of DNAPL. Product odor on bail water.	
						10/24/2006	7.05	Sheen	Present	0.7	Brown tar-like DNAPL on tip of probe, bailer and sorbent. Specs of DNAPL on sides of bailer and sorbent. Product odor on bail water	
						4/19/2007	3.62	Sheen	Present	0.2	Brown DNAPL smeared on tip of probe, bailer, and sorbent but no measurable amount. Slight odor on bail water. Specs of NAPL on sides of sorbent and bailer	
						10/17/2007	7.75	0.0	Present	0.0	Brown DNAPL smeared on tip of probe, bailer, and sorbent but no measurable amount. Slight odor on bail water. Specs of NAPL on sides of sorbent and bailer	
						4/24/2008	3.05	0.0	0.0	5.8	Minimal NAPL detected on bailer, sorbent, and probe. Slight NAPL odor on purge water, minor sheens present, no product observed.	
						10/9/2008	7.32	0.0	2.4	23.0	No LNAPL or DNAPL indicated by IF probe, but ~0.9' DNAPL on probe tape. ~2.4' DNAPL in bottom of well as measured with Bailer. 1.8L DNAPL removed by bailer along with ~3L of water/NAPL mix. After bailing (6 times) <0.1' measureable DNAPL in bottom of well	
						3/26/2009	6.24	0.0	3.4	30.1	39" DNAPL (no LNAPL). ~1.5 gallons NAPL bailed until <0.1' remained. No NAPL after 1 hour	
						4/22/2009	5.30	0.0	1.3	13.5	15" DNAPL (no LNAPL). ~800 ml NAPL & 1 gal. NAPL/water mix pumped. No NAPL after 18 hrs.	
						5/18/2009	6.01	0.0	0.6	35.0	7.5" DNAPL (no LNAPL). ~300 ml NAPL & 3 L. NAPL/Water mix pumped. No NAPLafter 18 hrs.	
						6/10/2009	6.90	0.0	0.4	24.8	5" DNAPL (no LNAPL). ~200 ml NAPL & 4 L. NAPL/Water mix pumped. No NAPL after 18 hrs.	
						7/14/2009	6.47	0.0	0.5	86.2	5.5" DNAPL (no LNAPL). ~400 ml NAPL & 4 L. NAPL/Water mix pumped. No NAPL after 18 hrs.	
						8/13/2009	6.42	0.0	0.3	36.5	3.8" DNAPL (No LNAPL). ~200 ml NAPL & 2 L. NAPL/Water mix pumped. No NAPL after 18 hrs.	
						9/8/2009	7.24	0.0	0.3	56.0	3.8" DNAPL (No LNAPL). ~0.2 L. NAPL & 2.5 L. NAPL/Water mix pumped. No NAPL after 18 hrs.	
						10/22/2009	7.48	0.0	0.8	36.0	10" DNAPL (no LNAPL). ~0.6 L. NAPL & 8 L. NAPL/Water mix pumped. No NAPL after 18 hrs.	
						4/21/2010	4.92	0.0	3.5	55.2	~3.5 ft. DNAPL (no LNAPL). 3 L. NAPL & 1 L. NAPL/Water mix pumped. Additional 200 ml NAPL removed after 30 min. (2 inch recovery of NAPL). No additional NAPL recovery after 1 hour.	
						10/14/2010	6.68	0.0	4.2	8.7	4.15 feet DNAPL in bottom of well (no LNAPL). 2 L NAPL and 3 Liter NAPL/Water mix removed with peristaltic pump. No additional NAPL recovery >0.1' after 1 hour

						10/1/2014	8.45	0.0	0.0	NM	No evidence of NAPL with interface probe or steel tape.
						1/21/2015	7.90	0.0	0.0	0.8	No evidence of LNAPL with interface probe. Soft bottom.
						5/4/2015	6.75	0.0	0.0	NM	No evidence of NAPL with interface probe
						10/5/2015	7.91	0.0	0.0	4.2	No evidence of NAPL. TD by IF probe = 37.4'

Notes: NM indicates measurement not performed on that date
"film" and "sheen" as described in the field notes indicate NAPL thickness less than 0.01 feet.
"present" indicates NAPL was observed on the water marker, interface probe or bailer, but thickness could not be measured.
fbtoc = feet below top of casing
PID = photoionization detector
ppmv = parts per million by volume
LNAPL = light NAPL
DNAPL = Dense NAPL

Pine Street Canal Site, Burlington, VT

(1) Vermont Quality Standards, July 2002, Appendix C: Water Quality Criteria for the Protection of Human Health and the Aquatic Biota (where applicable,a conservative median hardness of 51.4 mg/L as CaCO3 based on 64 samples from the Burlington Harbor Lake Station 21 was used to calculate standard)

GC/MS Qualifiers: B - The reported analyte was detected in the associated method blank as well as the sample. D - This flag indentifies all compounds identified in an analysis at a secondary dilution factor. This flag alerts data users that any discrepancies between the concentrations reported for the dilutions may be due to dilution of the sample or extract. It additionally indicates that spike recoveries may have been diluted below quantifiable levels. E - Compound quantitation is above the instrument's calibration range for this analysis. J - Indicates an estimated value. This flag is used when the result is less than the reporting limit, but >1/2 reporting limit or has been applied during data validation due to failure of one or more quality control criteria. U - Indicates compound was analyzed for but not detected above the reporting limit.

Metals Concentration Qualifiers: B - The reported value is less that the Contract Required Detection Limit (CRDL) or Practical Quantification Limit (PQL) but greater than the Instrument Detection Limit (IDL). U - Analyte was analyzed for but not detected, less than IDL, PQL, or CRDL.

Pine Street Canal Site, Burlington,VT
Summary of Cap Coring Analytical Results: PAHs

All Results in Parts per Billion (ppb) unless otherwise noted

GC/MS Qualifiers: B - The reported analyte was detected in the associated method blank as well as the sample. D - This flag indentifies all compounds identified in an analysis at a secondary dilution factor. This flag alerts data users that any discrepancies between the concentrations reported for the dilutions may be due to dilution of the sample or extract. It additionally indicates that spike recoveries may have been diluted below quantifiable levels. E - Compound quantitation is above the instrument's calibration range for this analysis. J - Indicates an estimated value. This flag is used when the result is less than the reporting limit, but >1/2 reporting limit or has been applied during data validation due to failure of one or more quality control criteria. U - Indicates compound was analyzed for but not detected above the reporting limit.

Metals Concentration Qualifiers: B - The report is less that the Contract Required Detection Limit (CRDL) or Practical Quantification Limit (PQL) but greater than the Instrument Detection Limit (IDL). U - Analyte was analyzed for but not detected, less than IDL, PQL, or CRDL. DL - Detection Limit, includes dilution and preparation information.

Blank space indicates data not available for the sample on the listed date. Either the sample was not collected, or no lab analytical results were generated for the specific compound.

Aqueous = Field Blank and/or QA Blank is aqueous matrix. Concentration for this sample is in Micrograms per Liter unless noted otherwise.

Pine Street Canal Site, Burlington,VT
Summary of Subaqueous Cap Coring Analytical Results: Metals
All results in Parts per Million (ppm), unless otherwise noted

GC/MS Qualifiers: B - The reported analyte was detected in the associated method blank as well as the sample. D - This flag indentifies all compounds identified in an analysis at a secondary dilution factor. This flag alerts data users that any discrepancies between the concentrations reported for the dilutions may be due to dilution of the sample or extract. It additionally indicates that spike recoveries may have been diluted below quantifiable levels. E - Compound quantitation is above the instrument's calibration range for this analysis. J - Indicates an estimated value. This flag is used when the result is less than the reporting limit, but >1/2 reporting limit or has been applied during data validation due to failure of one or more quality control criteria. U - Indicates compound was analyzed for but not detected above the reporting limit.

Metals Concentration Qualifiers: B - The report is less that the Contract Required Detection Limit (CRDL) or Practical Quantification Limit (PQL) but greater than the Instrument Detection Limit (IDL). U - Analyte was analyzed for but not detected, less than IDL, PQL, or CRDL. DL - Detection Limit, includes dilution and preparation information.

Blank space indicates data not available for the sample on the listed date. Either the sample was not collected, or no lab analytical results were generated for the specific compound.

Aqueous = Field Blank and/or QA Blank is aqueous matrix. Concentration for this sample is in Micrograms per Liter unless noted otherwise.

Pine Street Canal Site, Burlington, VT

Please note the following: U - The material was analyzed for, but was not detected above the level of the associated value. The associated value is either the sample quantitation limit or the sample detection limit. J - The associated numerical value is an estimated quantity. UJ - The material was analyzed for, but was not detected. The associated value is an estimate and may be inaccurate or imprecise. The sample quantitation limit is an estimated quantity. E - The reported value is estimated because of the presence of interference. N - Matrix spiked sample recovery not within control limits. B - The report is less than the Contract Required Detection Limit (CRDL) or Pracitacal Quantitation Limit (PQL) but greater than the Instrument Detection Limit (IDL). D - Sample results are obtained from a dilution; the surrogate or matrix spike recoveries are calculated from diluted samples. Blank - no data.

Pine Street Canal Site, Burlington, VT

GC/MS Qualifiers: B - The reported analyte was detected in the associated method blank as well as the sample. D - This flag indentifies all compounds identified in an analysis at a secondary dilution factor. This flag alerts data users that any discrepancies between the concentrations reported for the dilutions may be due to dilution of the sample or extract. It additionally indicates that spike recoveries may have been diluted below quantifiable levels. E - Compound quantitation is above the instrument's calibration range for this analysis. J - Indicates an estimated value. This flag is used when the reuslt is less than the reporting limit, but >1/2 reporting limit or has been applied during data validation due to failure of one or more quality control criteria. U - Indicates compound was analyzed for but not detected above the reporting limit.

Metals Concentration Qualifiers: B - The report is less that the Contract Required Detection Limit (CRDL) or Practical Quantification Limit (PQL) but greater than the Instrument Detection Limit (IDL). U - Analyte was analyzed for but not detected, less than IDL, PQL, or CRDL. DL - Detection Limit, includes dilution and preparation information.

Blank space indicates data not available for the sample on the listed date. Either the sample was not collected, or no lab analytical results were generated for the specific compound.

Pine Street Canal Site, Burlington, VT
Summary of Groundwater Analytical Data: PAHs
(All results in Micrograms per Liter - ppb)

SLID	SIN	Date	2-Methyl-naphthalene	Acenaphthene	Acenaphthylene	Anthracene	Benzo(a)-anthracene	Benzo(a)pyrene	Benzo(b)-fluoranthene	Benzo(g,h,i)-perylene	Benzo(k)-fluoranthene	Chrysene	Dibenz(a,h)-anthracene	Fluoranthene	Fluorene	Indeno(1,2,3-cd)-pyrene	Naphthalene	Phenanthrene	Pyrene

GC/MS Qualifiers: B - The reported analyte was detected in the associated method blank as well as the sample. D - This flag indentifies all compounds identified in an analysis at a secondary dilution factor. This flag alerts data users that any discrepancies between the concentrations reported for the dilutions may be due to dilution of the sample or extract. It additionally indicates that spike recoveries may have been diluted below quantifiable levels. E - Compound quantitation is above the instrument's calibration range for this analysis. J - Indicates an estimated value. This flag is used when the reuslt is less than the reporting limit, but >1/2 reporting limit or has been applied during data validation due to failure of one or more quality control criteria. U - Indicates compound was analyzed for but not detected above the reporting limit.

Metals Concentration Qualifiers: B - The report is less that the Contract Required Detection Limit (CRDL) or Practical Quantification Limit (PQL) but greater than the Instrument Detection Limit (IDL). U - Analyte was analyzed for but not detected, less than IDL, PQL, or CRDL. DL - Detection Limit, includes dilution and preparation information.

Blank space indicates data not available for the sample on the listed date. Either the sample was not collected, or no lab analytical results were generated for the specific compound.

Pine Street Canal Site, Burlington, VT
Summary of Groundwater Analytical Data: Metals
(All results in Micrograms per Liter - ppb)

GC/MS Qualifiers: B - The reported analyte was detected in the associated method blank as well as the sample. D - This flag indentifies all compounds identified in an analysis at a secondary dilution factor. This flag alerts data users that any discrepancies between the concentrations reported for the dilutions may be due to dilution of the sample or extract. It additionally indicates that spike recoveries may have been diluted below quantifiable levels. E - Compound quantitation is above the instrument's calibration range for this analysis. J - Indicates an estimated value. This flag is used when the result is less than the reporting limit, but >1/2 reporting limit or has been applied during data validation due to failure of one or more quality control criteria. U - Indicates compound was analyzed for but not detected above the reporting limit.

Metals Concentration Qualifiers: B - The report is less that the Contract Required Detection Limit (CRDL) or Practical Quantification Limit (PQL) but greater than the Instrument Detection Limit (IDL). U - Analyte was analyzed for but not detected, less than IDL, PQL, or CRDL. DL - Detection Limit, includes dilution

Blank space indicates data not available for the sample on the listed date. Either the sample was not collected, or no lab analytical results were generated for the spe

APPENDIX 4

APPENDIX 5

CHAINS-OF-CUSTODY

Environmental Analysis Request/Chain of Custody

384521

eurofins | Lancaster Laboratories Environmental

Acct. # _____ For Eurofins Lancaster Laboratories Environmental use only Group # _____ Sample # _____

Instructions on reverse side correspond with circled numbers.

(1) Client Information

Client: The Johnson Company	Acct. #: 06556
Project Name/#: Pine Street Canal / 1-0870-2	PWSID #:
Project Manager: Jim Bowers	P.O. #:
Sampler: Adam Robtoy	Quote #: 174980
Name of state where samples were collected:	

(4) Matrix

Sediment ☒ Soil ☐ | Water: Ground ☐ Potable ☐ Surface ☐ NPDES ☐ | Other: ____

(5) Analysis Requested

Preservation Codes: O O | O | O

For Lab Use Only

FSC: _____

SCR#: 174980

Preservation Codes

H=HCl T=Thiosulfate
N=HNO_3 B=NaOH
S=H_2SO_4 O=Other

00159 Mercury

The solution resulting from the mercury digestion is analyzed by Cold Vapor AA.

Reference: Test Methods for Evaluating Solid Wastes, SW-846 Method 7471A, September 1994

04792 All Inst./ Non-digest - U3

The sample is digested with nitric acid and hydrogen peroxide.

Reference: Test Methods for Evaluating Solid Wastes, SW-846 Method 3050B, December 1996

06953 Copper
06955 Lead
06972 Zinc

The solution resulting from the metals digestion is analyzed by Trace ICP.

Reference: Test Methods for Evaluating Solid Wastes, SW-846 Method 6010B, December 1996.

13994 TOC Subcontracted - Spectrum

Total organic carbon is determined by acidifying a sample aliquot and heating it to remove any inorganic carbon. The sample is then heated to 900oC for combustion of the remaining organic carbon. The resulting carbon dioxide from the organic carbon is detected by a nondispersive infrared detector that has been calibrated to directly display the mass of carbon dioxide detected. The mass is proportional to the mass of total organic carbon in the sample.

Reference: Lloyd Kahn (modified)

01630 Acid Volatile Sulfide

A measured volume of sample is purged under nitrogen gas and then acidified with hydrochloric acid (HCL). Any AVS in the sample is converted to hydrogen sulfide which is purged from the sample and trapped in an aqueous solution of antioxidant buffer. The amount of sulfide is determined by an ion-selective electrode (ISE). The millivolt value is read and compared to a standard curve.

Reference: EPA-821-R-91-100 "Draft Analytical Method for the Determination of Acid Volatile Sulfide in Sediment", December 1991

07103 Grain Size to 1 um

A thoroughly dried soil is ground using a rubber pestle to break the aggregations. The ground soil is then sieved to determine percentage of particles passing sizes in the range 75 - 2.36 mm. Particles finer than 2.36 mm are soaked in a dispersing agent for 16 hours and the particle sizes from 0.075 mm - 0.001 mm are determined by a sedimentation process using a hydrometer. The soil from the hydrometer test is dried and then sieved to determine percentage of particles passing sizes in the range 1.18 - 0.075 mm.

Reference: ASTM D422, Standard Test Method for Particle-Size Analysis of Soil

---

00111 Moisture
00118 Moisture
00121 Moisture Duplicate

A well-mixed sample is placed in a tared container and dried to a constant weight in an oven at 103-105C. The increase in weight is the total solids.

Reference: Standard Methods for the Examination of Water and Wastewater, 20th Edition, 1998, Method 2540 G-1997

12815 Sample Decanting

Decanting is used to separate the liquid from an insoluble solid. As the solid settles to the bottom of the container, the liquid is carefully poured into another container leaving the solid behind.

Quality Control Summary

Client Name: The Johnson Company, Inc. Group Number: 1596019
Reported: 12/16/2015 08:47

Matrix QC may not be reported if insufficient sample or site-specific QC samples were not submitted. In these situations, to demonstrate precision and accuracy at a batch level, a LCS/LCSD was performed, unless otherwise specified in the method.

All Inorganic Initial Calibration and Continuing Calibration Blanks met acceptable method criteria unless otherwise noted on the Analysis Report.

PROCEDURE - DEVIATION

ALERT!

DRAFT

Alert No: RJP- Method #007 – 2015-1
To: Pine Street Canal Site QA File
CC: Guy Vaillancourt - Project Manager
From: Ross Predom, Staff Scientist
Date: 09/30/15
Re: Chain of Custody # 384523 Transcription Error: Incorrect Sample Identification Number

BACKGROUND: Chain of Custody # 384523 and sample labels were submitted with an incorrect Sample Identification Number (SIN) for the benthic sample J_T21+00-E50 collected on 9/22/15 at 10:45. The correct SIN for this location is 0499-13. Chain of Custody (COC) 384523 was submitted with the incorrect SIN of 0498-13, and the analytical lab logged the sample in under the SIN that was incorrectly entered on the COC (laboratory sample numbers 8064406 and 8064407).

ACTION: The laboratory was initially notified of the error and correct SIN was provided by email after receipt of the log-in report. Alert was prepared for the Project Manager by the Staff Scientist and copied to the analytical laboratory. A copy of this PDA will also be included with the Fall 2015 Compliance Monitoring Report, and also with the original laboratory data package. The correct SIN will be transcribed onto the original laboratory report, and will be entered into the project database for this sample so that the sample results for the 2015 cap coring and benthic monitoring event appear at the correct SLID location.

Cc: Jim Bowes; Deborah Gaynor; Sonja Schuyler; Don Maynard
Subject: CORRECTION****1594773-Pine Street Canal - Sand Cap Sampling
Date: Monday, September 28, 2015 10:35:17 AM

Good morning Wendy,

I need to alert you to a mistake on a COC for the Pine Street Canal cap sampling that occurred last week: on COC # 384523, the sample with SLID J_T-21+00-E50 (time 1045) should have a SIN of 0499-13 (not 0498-13), as shown correctly on COC # 384522. I imagine that the corresponding sample jars had this incorrect SIN as well. We will generate a Procedure Deviation Alert and send along shortly.

Thank you,

Johanna Palmer
The Johnson Company

Authorized by:

June O'Connor
Laboratory Director

Eurofins Spectrum Analytical holds certification in the State of New York for the analytes as indicated with an X in the "Cert." column within this report. Please note that the State of New York does not offer certification for all analytes. Please refer to our website for specific certification holdings in each state.
Please note that this report contains 7 pages of analytical data plus Chain of Custody document(s). When the Laboratory Report is indicated as revised, this report supersedes any previously dated reports for the laboratory ID(s) referenced above. Where this report identifies subcontracted analyses, copies of the subcontractor's test report are available upon request. This report may not be reproduced, except in full, without written approval from Eurofins Spectrum Analytical, Inc.

Eurofins Spectrum Analytical, Inc. is a NELAC accredited laboratory organization and meets NELAC testing standards. Use of the NELAC logo however does not insure that Spectrum is currently accredited for the specific method or analyte indicated. Please refer to our Quality web page at www.spectrum-analytical.com for a full listing of our current certifications and fields of accreditation. States in which Spectrum Analytical, Inc. holds NELAC certification are New York, New Hampshire, New Jersey, Pennsylvania and Florida. All analytical work for Volatile Organic and Air analysis are transferred to and conducted at our 830 Silver Street location (PA-68-04426).

Please contact the Laboratory or Technical Director at 800-789-9115 with any questions regarding the data contained in this laboratory report.

CASE NARRATIVE:

Data has been reported to the RDL. This report excludes estimated concentrations detected below the RDL and above the MDL (J-Flag).

All non-detects and all results below the reporting limit are reported as "<" (less than) the reporting limit in this report.

The samples were received -0.3 degrees Celsius, please refer to the Chain of Custody for details specific to temperature upon receipt. An infrared thermometer with a tolerance of +/- 1.0 degrees Celsius was used immediately upon receipt of the samples.

If a Matrix Spike (MS), Matrix Spike Duplicate (MSD) or Duplicate (DUP) was not requested on the Chain of Custody, method criteria may have been fulfilled with a source sample not of this Sample Delivery Group.

October 28, 2015 Report Revision Case Narrative:

This report has been revised to include sample ID correction per client request.

There is no relevant protocol-specific QC and/or performance standards non-conformances to report.

Sample Acceptance Check Form

Client:	Eurofins Lancaster Laboratories Environmental, LLC
Project:	See Chain of Custody / 1596019
Work Order:	SC13118
Sample(s) received on:	10/2/2015

The following outlines the condition of samples for the attached Chain of Custody upon receipt.

	Yes	No	N/A
Were custody seals present?	☑	☐	☐
Were custody seals intact?	☑	☐	☐
Were samples received at a temperature of ≤ 6°C?	☑	☐	☐
Were samples cooled on ice upon transfer to laboratory representative?	☑	☐	☐
Were sample containers received intact?	☑	☐	☐
Were samples properly labeled (labels affixed to sample containers and include sample ID, site location, and/or project number and the collection date)?	☑	☐	☐
Were samples accompanied by a Chain of Custody document?	☑	☐	☐
Does Chain of Custody document include proper, full, and complete documentation, which shall include sample ID, site location, and/or project number, date and time of collection, collector's name, preservation type, sample matrix and any special remarks concerning the sample?	☐	☑	☐
Did sample container labels agree with Chain of Custody document?	☑	☐	☐
Were samples received within method-specific holding times?	☑	☐	☐

Notes and Definitions

dry	Sample results reported on a dry weight basis
NR	Not Reported
RPD	Relative Percent Difference

Laboratory Control Sample (LCS): A known matrix spiked with compound(s) representative of the target analytes, which is used to document laboratory performance.

Matrix Duplicate: An intra-laboratory split sample which is used to document the precision of a method in a given sample matrix.

Matrix Spike: An aliquot of a sample spiked with a known concentration of target analyte(s). The spiking occurs prior to sample preparation and analysis. A matrix spike is used to document the bias of a method in a given sample matrix.

Method Blank: An analyte-free matrix to which all reagents are added in the same volumes or proportions as used in sample processing. The method blank should be carried through the complete sample preparation and analytical procedure. The method blank is used to document contamination resulting from the analytical process.

Method Detection Limit (MDL): The minimum concentration of a substance that can be measured and reported with 99% confidence that the analyte concentration is greater than zero and is determined from analysis of a sample in a given matrix type containing the analyte.

Reportable Detection Limit (RDL): The lowest concentration that can be reliably achieved within specified limits of precision and accuracy during routine laboratory operating conditions. For many analytes the RDL analyte concentration is selected as the lowest non-zero standard in the calibration curve. While the RDL is approximately 5 to 10 times the MDL, the RDL for each sample takes into account the sample volume/weight, extract/digestate volume, cleanup procedures and, if applicable, dry weight correction. Sample RDLs are highly matrix-dependent.

Surrogate: An organic compound which is similar to the target analyte(s) in chemical composition and behavior in the analytical process, but which is not normally found in environmental samples. These compounds are spiked into all blanks, standards, and samples prior to analysis. Percent recoveries are calculated for each surrogate.

Continuing Calibration Verification: The calibration relationship established during the initial calibration must be verified at periodic intervals. Concentrations, intervals, and criteria are method specific.

SDG13118

SC13118 General Narrative

Eurofins Spectrum Analytical, Inc. submits the enclosed data package for the site characterization of See Chain of Custody. Samples submitted for analysis by Eurofins Lancaster Laboratories Environmental, LLC. Under this deliverable, analysis results are presented for four Sediment samples submitted on October 2nd, 2015.

The analyses were performed according to USEPA SW846 method analytical guidelines and other methods. In addition the analyses were performed according to criteria dictated by National Environmental Laboratory Accreditation Conference (NELAC) and in accordance with project contract requirements and chain of custody forms.

Observations and/or deviations observed for specific analyses can be found in the analysis narrative:

1. Overall Observations:

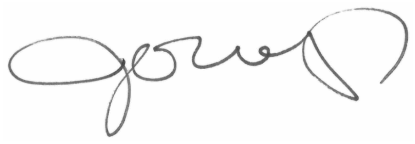
Where needed, manual integrations were performed to improve data quality. The corrections were reviewed and associated hardcopies generated and reported as required. Manual Integrations are coded to provide the data reviewer justification for such action. The codes are labeled on corresponding raw data for GC/MS and GC analysis as follows:

- M1 peak tailing or fronting
- M2 peak co-elution
- M3 rising or failing baseline
- M4 retention time shift
- M5 miscellaneous - under this category, the justification is explained
- M6 software did not integrate peak
- M7 partial peak integration

The enclosed report includes the originals of all data with the exception of logbook pages and certain initial calibrations. Scanned copies of logbook pages are included, with the originals are archived within the laboratory.

The pages in this report have been numbered consecutively, starting with the general narrative and ending with the page labeled as "Last Page of data Report".

I certify that this data package is in compliance with the terms and conditions of the contract, both technically and for completeness, for other than the conditions detailed above. Release of the data contained in this electronic data package, has been authorized by the laboratory director as verified by the following signature.



June O'Connor Date: 11/04/2015

Laboratory Director

Executive Summary - Detection Highlights

Sample ID: 0182-13 DP

Parameter	Result	Flag	Reporting Limit	Units	Analytical Method
Total Organic Carbon	54800		769	mg/kg	Lloyd Kahn

Sample ID: 0479-13

Parameter	Result	Flag	Reporting Limit	Units	Analytical Method
Total Organic Carbon	192000		1900	mg/kg	Lloyd Kahn

Sample ID: 0489-13

Parameter	Result	Flag	Reporting Limit	Units	Analytical Method
Total Organic Carbon	50000		1380	mg/kg	Lloyd Kahn

Sample ID: 0499-13

Parameter	Result	Flag	Reporting Limit	Units	Analytical Method
Total Organic Carbon	219000		5000	mg/kg	Lloyd Kahn

Please note that this summary does not include hits from hazardous waste characterizations or micro analyses, because they do not have minimum detection limits.

CASE NARRATIVE

Spectrum Analytical, Inc. Lab Reference No. SC13118

Client: Eurofins Lancaster Laboratories Environmental, LLC

Project: See Chain of Custody / 1596019

SDG #: 13118

I. RECEIPT

No exceptions were encountered unless a Sample Receipt Exception or a communication form is included in the addendum with this package.

II. HOLDING TIMES

All samples were prepared and analyzed within the method-specific holding time.

III. METHODS

Analyses were performed according to Lloyd Kahn.

IV. PREPARATION

Soil/Sediment samples were prepared according to General Preparation.

V. INSTRUMENTATION

The following equipment was used to analyze Lloyd Kahn:

TOC2 details: Teledyne Tekmar Apollo 9000 / TOC Boat Sampler Model 183

VI. ANALYSIS

A. Calibration:

All quality control samples were within the acceptance criteria.

B. Blanks:

All blanks were within the acceptance criteria.

C. Spikes:

1. Laboratory Control Samples (LCS):

All method criteria were met.

2. Matrix Spike / Matrix Spike Duplicate Samples (MS/MSD):

No matrix spike or matrix spike duplicates were analyzed.

3. Reference:

All method criteria were met.

D. Duplicates:

No client requested duplicate. However, the method criteria may have been fulfilled with non-SDG source samples.

E. Samples:

All method criteria were met with the following exceptions:

October 28, 2015 Report Revision Case Narrative:

This report has been revised to include sample ID correction per client request.

Notes & Definitions

BRL Below the reporting limit and also indicates there are no detections between the MDL and MRL

Form I 'Q' column

B The analyte was found in the associated blank as well as the sample

D All identified compounds in the analysis are at a secondary dilution factor

E The identified compound's concentration exceeds the calibration range of the instrument for this specific analysis

J Compound detected but below the reporting limit and above the minimum detection limit (MDL); therefore, the result is an estimated concentration

N Included for TIC that indicates presumptive evidence of a compound

P Used for a Dual Column target analyte when the concentration difference between the two GC columns is greater than 40%.

U Compound was analyzed for but not detected

Form IIa 'Method' column

This column refers to the instrument used for analysis

IR Iris ICP
MS Thermo ICP/MS
AV Mercury analyzer

Form VI 'Q' column

***** indicates that:
Mean RF is above the value in the LIMIT column, or
Linear COD is below the value in the LIMIT column, or
Quad COD is below the value in the LIMIT column

Form VII 'Type' column

A average of response factor
L linear regression
Q quadratic equation

Form VIII 'Q' column for Inorganics

E The dilution analysis is not within a control limit of 10%, therefore a chemical or physical interference effect must be suspected

Explanation of Symbols and Abbreviations

The following defines common symbols and abbreviations used in reporting technical data:

RL	Reporting Limit	**BMQL**	Below Minimum Quantitation Level
N.D.	none detected	**MPN**	Most Probable Number
TNTC	Too Numerous To Count	**CP Units**	cobalt-chloroplatinate units
IU	International Units	**NTU**	nephelometric turbidity units
umhos/cm	micromhos/cm	**ng**	nanogram(s)
C	degrees Celsius	**F**	degrees Fahrenheit
meq	milliequivalents	**lb.**	pound(s)
g	gram(s)	**kg**	kilogram(s)
µg	microgram(s)	**mg**	milligram(s)
mL	milliliter(s)	**L**	liter(s)
m3	cubic meter(s)	**µL**	microliter(s)
		pg/L	picogram/liter

< less than

> greater than

ppm parts per million - One ppm is equivalent to one milligram per kilogram (mg/kg) or one gram per million grams. For aqueous liquids, ppm is usually taken to be equivalent to milligrams per liter (mg/l), because one liter of water has a weight very close to a kilogram. For gases or vapors, one ppm is equivalent to one microliter per liter of gas.

ppb parts per billion

Dry weight basis Results printed under this heading have been adjusted for moisture content. This increases the analyte weight concentration to approximate the value present in a similar sample without moisture. All other results are reported on an as-received basis.

Laboratory Data Qualifiers:

B - Analyte detected in the blank
C - Result confirmed by reanalysis
E - Concentration exceeds the calibration range
J (or G, I, X) - estimated value ≥ the Method Detection Limit (MDL or DL) and < the Limit of Quantitation (LOQ or RL)
P - Concentration difference between the primary and confirmation column >40%. The lower result is reported.
U - Analyte was not detected at the value indicated
V - Concentration difference between the primary and confirmation column >100%. The reporting limit is raised due to this disparity and evident interference…

Additional Organic and Inorganic CLP qualifiers may be used with Form 1 reports as defined by the CLP methods.
Qualifiers specific to Dioxin/Furans and PCB Congeners are detailed on the individual Analysis Report.

Analytical test results meet all requirements of the associated regulatory program (i.e., NELAC (TNI), DoD, and ISO 17025) unless otherwise noted under the individual analysis.

Measurement uncertainty values, as applicable, are available upon request.

Tests results relate only to the sample tested. Clients should be aware that a critical step in a chemical or microbiological analysis is the collection of the sample. Unless the sample analyzed is truly representative of the bulk of material involved, the test results will be meaningless. If you have questions regarding the proper techniques of collecting samples, please contact us. We cannot be held responsible for sample integrity, however, unless sampling has been performed by a member of our staff.

This report shall not be reproduced except in full, without the written approval of the laboratory.

Times are local to the area of activity. Parameters listed in the 40 CFR Part 136 Table II as “analyze immediately” are not performed within 15 minutes.

WARRANTY AND LIMITS OF LIABILITY - In accepting analytical work, we warrant the accuracy of test results for the sample as submitted. THE FOREGOING EXPRESS WARRANTY IS EXCLUSIVE AND IS GIVEN IN LIEU OF ALL OTHER WARRANTIES, EXPRESSED OR IMPLIED. WE DISCLAIM ANY OTHER WARRANTIES, EXPRESSED OR IMPLIED, INCLUDING A WARRANTY OF FITNESS FOR PARTICULAR PURPOSE AND WARRANTY OF MERCHANTABILITY. IN NO EVENT SHALL EUROFINS LANCASTER LABORATORIES ENVIRONMENTAL, LLC BE LIABLE FOR INDIRECT, SPECIAL, CONSEQUENTIAL, OR INCIDENTAL DAMAGES INCLUDING, BUT NOT LIMITED TO, DAMAGES FOR LOSS OF PROFIT OR GOODWILL REGARDLESS OF (A) THE NEGLIGENCE (EITHER SOLE OR CONCURRENT) OF EUROFINS LANCASTER LABORATORIES ENVIRONMENTAL AND (B) WHETHER EUROFINS LANCASTER LABORATORIES ENVIRONMENTAL HAS BEEN INFORMED OF THE POSSIBILITY OF SUCH DAMAGES. We accept no legal responsibility for the purposes for which the client uses the test results. No purchase order or other order for work shall be accepted by Eurofins Lancaster Laboratories Environmental which includes any conditions that vary from the Standard Terms and Conditions, and Eurofins Lancaster Laboratories Environmental hereby objects to any conflicting terms contained in any acceptance or order submitted by client.

ICP Metals

Fraction: Metals in Solid

Sample #	Client ID	Matrix Liquid	Matrix Solid	DF	Comments
8064406	0499-13		X	1	
8064408	0479-13		X	1	
8064410	0489-13		X	1	Background/Unspiked
8064413	0489-13 MS		X	1	Matrix Spike
8064414	0489-13 MSD		X	1	Matrix Spike Duplicate
8064415	0489-13 DUP		X	1	Duplicate
8064416	0182-13 DP		X	1	Field Duplicate Sample

See QC Reference List for Associated Batch QC Samples

SAMPLE RECEIPT:

Samples were received in good condition and within temperature requirements.

HOLDING TIME:

All holding times were met.

PREPARATION/EXTRACTION/DIGESTION:

No problems were encountered.

CALIBRATION/STANDARDIZATION:

All criteria were met.

QUALITY CONTROL AND NONCONFORMANCE SUMMARY:

Method Blank

For noncompliant preparation/method blanks, corrective action is not required if the sample is ND or > 10 times the blank concentration, unless otherwise specified in the method or by the client.

LCS/LCSD

MS/MSD

Method defined actions are taken for any failed matrix QC.

eurofins | Lancaster Laboratories Environmental

ICP Metals

Fraction: Metals in Solid

Batch#: 152794792002 (Sample number(s): 8064406, 8064408, 8064410, 8064413-8064416, UNSPK: 8064410, BKG: 8064410)
The recovery(ies) for the following analyte(s) in the MS and MSD is outside the acceptance window: Copper, Lead, Mercury, Zinc
Refer to the QC Summary forms for more information.

Surrogate

Sample Duplicate

Serial Dilution

Post Digestion Spike

SAMPLE ANALYSIS:

No problems were encountered with the analysis of the samples.

The instrument detection limits (IDLs) are used for determining the U flags on the initial and continuing calibration blanks. The highest IDL is selected when multiple instruments are used for an analysis. The method detection limits (MDLs) are used for determining all other U flags.

Additional Comments

(Sample number(s): 8064406, 8064408, 8064410, 8064413-8064416: Analysis: 06955)
After consultation with the client, the reporting limit for Lead was raised due to a detection in the Method Blank.

Abbreviation Key

BKG – Background	AF - Cold Vapor Atomic Fluorescence
DUP – Duplicate	U - Below MDL
MS - Matrix Spike	B - Below LOQ
MSD - Matrix Spike Dup	N - Matrix Spike out of specifications

Case Narrative/Conformance Summary

CLIENT: The Johnson Company, Inc.
SDG: PSC26

ICP Metals

Fraction: Metals in Solid

B – Blank	* - Duplicate out of specifications
Q - Laboratory Control Sample	E - Matrix Effects exist as proven by Serial Dilution or Spiked Dilution
Y - Laboratory Control Sample Duplicate	A - Post Digestion Spike
P - ICP Atomic Emission Spectrometer	L - Serial Dilution
MS - ICP Mass Spectrometry	R - Internal Standard Relative Intensity OOS
CV - Cold Vapor	NR - Not Required

METHODS:
P = ICP Atomic Emission Spectrometer
MS = ICP Mass Spectrometry
CV = Cold Vapor
AF = Cold Vapor Atomic Fluorescence

LEGEND:
BKG = Background
DUP = Duplicate
MS = Matrix Spike
MSD = Matrix Spike Duplicate
A = Post Digest Spike
L = Serial Dilution
B = Blank
Q = Laboratory Control Sample
Y = Laboratory Control Sample Duplicate

ICP-AES Run Data Report

Reviewed By
Katlin N Cataldi

Reviewed Date
10/07/2015 9:19AM

Data File Name 1527907T73.TXT
Run Name: 1527907T73

Method Reference Name(s):

Verified By:
Deborah A Krady

Verified Date
10/07/2015 9:45AM

Analyst Employee: 0463

Instrument Parameters:

Individual Integration Time: 10.00 sec Total Integration Time: 30.00 sec Rinse Time: 15.00 sec

Element	Analyte Name	Wavelength Value
AG	Silver	328.06
AL	Aluminum	308.21
AS	Arsenic	189.04
AU	Gold	242.80
B	Boron	249.67
BA	Barium	455.40
BE	Beryllium	313.04
CA	Calcium	317.93
CD	Cadmium	226.50
CO	Cobalt	228.62
CR	Chromium	267.72
CU	Copper	327.40
FE	Iron	261.19
K	Potassium	766.49
LI	Lithium	670.78
MG	Magnesium	285.21
MN	Manganese	257.61
MO	Molybdenum	202.03
NA	Sodium	589.59
NI	Nickel	231.60
P	Phosphorus	177.49
PB	Lead	220.35
SB	Antimony	206.83
SE	Selenium	196.09
SI	Silicon	251.60
SN	Tin	189.99
SR	Strontium	421.55
TE	Tellurium	214.28
TH	Thorium	401.91
TI	Titanium	334.94
TL	Thallium	190.86
V	Vanadium	292.40
W	Tungsten	207.91
Y1	Yttrium	224.31
Y2	Yttrium	371.03
ZN	Zinc	213.86
ZR	Zirconium	339.19

The TRACE ICP utilizes Yttrium as an internal standard to compensate for fluctuations in nebulization and plasma conditions. All Yttrium readings are expressed in counts.

SC13118 General Narrative

Eurofins Spectrum Analytical, Inc. submits the enclosed data package for the site characterization of See Chain of Custody. Samples submitted for analysis by Eurofins Lancaster Laboratories Environmental, LLC. Under this deliverable, analysis results are presented for four Sediment samples submitted on October 2nd, 2015.

The analyses were performed according to USEPA SW846 method analytical guidelines and other methods. In addition the analyses were performed according to criteria dictated by National Environmental Laboratory Accreditation Conference (NELAC) and in accordance with project contract requirements and chain of custody forms.

Observations and/or deviations observed for specific analyses can be found in the analysis narrative:

1. Overall Observations:

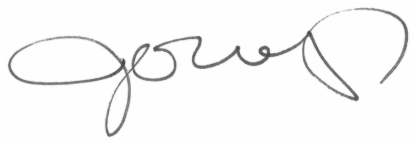
Where needed, manual integrations were performed to improve data quality. The corrections were reviewed and associated hardcopies generated and reported as required. Manual Integrations are coded to provide the data reviewer justification for such action. The codes are labeled on corresponding raw data for GC/MS and GC analysis as follows:

- M1 peak tailing or fronting
- M2 peak co-elution
- M3 rising or failing baseline
- M4 retention time shift
- M5 miscellaneous - under this category, the justification is explained
- M6 software did not integrate peak
- M7 partial peak integration

The enclosed report includes the originals of all data with the exception of logbook pages and certain initial calibrations. Scanned copies of logbook pages are included, with the originals are archived within the laboratory.

The pages in this report have been numbered consecutively, starting with the general narrative and ending with the page labeled as "Last Page of data Report".

I certify that this data package is in compliance with the terms and conditions of the contract, both technically and for completeness, for other than the conditions detailed above. Release of the data contained in this electronic data package, has been authorized by the laboratory director as verified by the following signature.



June O'Connor Date: 11/04/2015

Laboratory Director

Executive Summary - Detection Highlights

Sample ID: 0182-13 DP

Parameter	Result	Flag	Reporting Limit	Units	Analytical Method
Total Organic Carbon	54800		769	mg/kg	Lloyd Kahn

Sample ID: 0479-13

Parameter	Result	Flag	Reporting Limit	Units	Analytical Method
Total Organic Carbon	192000		1900	mg/kg	Lloyd Kahn

Sample ID: 0489-13

Parameter	Result	Flag	Reporting Limit	Units	Analytical Method
Total Organic Carbon	50000		1380	mg/kg	Lloyd Kahn

Sample ID: 0499-13

Parameter	Result	Flag	Reporting Limit	Units	Analytical Method
Total Organic Carbon	219000		5000	mg/kg	Lloyd Kahn

Please note that this summary does not include hits from hazardous waste characterizations or micro analyses, because they do not have minimum detection limits.

CASE NARRATIVE

Spectrum Analytical, Inc. Lab Reference No. SC13118

Client: Eurofins Lancaster Laboratories Environmental, LLC

Project: See Chain of Custody / 1596019

SDG #: 13118

I. RECEIPT

No exceptions were encountered unless a Sample Receipt Exception or a communication form is included in the addendum with this package.

II. HOLDING TIMES

All samples were prepared and analyzed within the method-specific holding time.

III. METHODS

Analyses were performed according to Lloyd Kahn.

IV. PREPARATION

Soil/Sediment samples were prepared according to General Preparation.

V. INSTRUMENTATION

The following equipment was used to analyze Lloyd Kahn:

TOC2 details: Teledyne Tekmar Apollo 9000 / TOC Boat Sampler Model 183

VI. ANALYSIS

A. Calibration:

All quality control samples were within the acceptance criteria.

B. Blanks:

All blanks were within the acceptance criteria.

C. Spikes:

1. Laboratory Control Samples (LCS):

All method criteria were met.

2. Matrix Spike / Matrix Spike Duplicate Samples (MS/MSD):

No matrix spike or matrix spike duplicates were analyzed.

3. Reference:

All method criteria were met.

D. Duplicates:

No client requested duplicate. However, the method criteria may have been fulfilled with non-SDG source samples.

E. Samples:

All method criteria were met with the following exceptions:

October 28, 2015 Report Revision Case Narrative:

This report has been revised to include sample ID correction per client request.

Notes & Definitions

BRL Below the reporting limit and also indicates there are no detections between the MDL and MRL

Form I 'Q' column

B The analyte was found in the associated blank as well as the sample

D All identified compounds in the analysis are at a secondary dilution factor

E The identified compound's concentration exceeds the calibration range of the instrument for this specific analysis

J Compound detected but below the reporting limit and above the minimum detection limit (MDL); therefore, the result is an estimated concentration

N Included for TIC that indicates presumptive evidence of a compound

P Used for a Dual Column target analyte when the concentration difference between the two GC columns is greater than 40%.

U Compound was analyzed for but not detected

Form IIa 'Method' column

This column refers to the instrument used for analysis

IR Iris ICP
MS Thermo ICP/MS
AV Mercury analyzer

Form VI 'Q' column

***** indicates that:
Mean RF is above the value in the LIMIT column, or
Linear COD is below the value in the LIMIT column, or
Quad COD is below the value in the LIMIT column

Form VII 'Type' column

A average of response factor
L linear regression
Q quadratic equation

Form VIII 'Q' column for Inorganics

E The dilution analysis is not within a control limit of 10%, therefore a chemical or physical interference effect must be suspected

eurofins | Lancaster Laboratories Environmental

Case Narrative/Conformance Summary

CLIENT: The Johnson Company, Inc.
SDG: PSC26

Instrumental Water Quality

Fraction: Instrumental Wet Chemistry

Sample #	Client ID	Matrix Liquid	Matrix Solid	DF	Comments
8064407	0499-13		X	1	
8064409	0479-13		X	1	
8064412	0489-13		X	1	
8064417	0182-13 DP		X	1	Field Duplicate Sample

See QC Reference List for Associated Batch QC Samples

SAMPLE RECEIPT:

Samples were received in good condition and within temperature requirements.

HOLDING TIME:

All holding times were met.

PREPARATION/EXTRACTION/DIGESTION:

No problems were encountered.

CALIBRATION/STANDARDIZATION:

All criteria were met.

QUALITY CONTROL AND NONCONFORMANCE SUMMARY:

MS/MSD

Matrix QC may not be included if site-specific QC were not submitted. In these situations, to demonstrate precision and accuracy at a batch level, laboratory spike data (LCS) are provided.

SAMPLE ANALYSIS:

The TOC analysis was subcontracted to another laboratory.

Case Narrative/Conformance Summary

SAMPLE RECEIPT:

Samples were received in good condition and within temperature requirements.

HOLDING TIME:

All holding times were met.

PREPARATION/EXTRACTION/DIGESTION:

No problems were encountered.

CALIBRATION/STANDARDIZATION:

All criteria were met.

QUALITY CONTROL AND NONCONFORMANCE SUMMARY:

Sample Duplicate

Method defined actions are taken for any failed matrix QC.

Batch#: 15278163001A (Sample number(s): 8064406, 8064408, 8064410, 8064413-8064416, UNSPK: 8064410, BKG: 8064410)
The duplicate RPD for the following analyte(s) is outside the acceptance window: Acid Volatile Sulfide

SAMPLE ANALYSIS:

Sample #	AVS Result umole/g	LOQ umole/g	AVS Result mg/kg	LOQ mg/kg
8064406	18.2	2.0	583.5	64.1
8064408	11.1	2.0	355.9	64.1
8064410	3.1	2.0	99.4	64.1
8064413	32.5	2.0	1042.0	64.1
8064414	37.4	2.0	1199.0	64.1
8064415	2.0	2.0	64.1	64.1
8064416	2.8	2.0	89.8	64.1

No problems were encountered with the analysis of the samples.

Abbreviation Key

U = Unspiked (for MS/MSD)	LOQ = Limit of Quantitation
R = Matrix Spike (MS)	MDL = Method Detection Limit
M = Matrix Spike Duplicate (MSD)	ND = Not Detected
BKG = Background (for Duplicate)	J = Estimated Value
D = Duplicate (DUP)	NA = Not Applicable
HS = High Spike	ME = Method
LS = Low Spike	CO = Colorimetric
SS = Soluble Spike	G = Gravimetric
IS = Insoluble Spike	IR = Infrared Spectrophotometry
ISD = Insoluble Spike Duplicate	MTR = Meter
PDS = Post Digestion Spike	OD = Oven Dried
* = Out of Specification	TI = Titration
V = Visual	TOC = Total Organic Carbon
AK = Alpkem	IC = Ion Chromatography
TC = Total Carbon	RA = Rapid Analyzer

Check Code Key
PK = Original container checked - pH is within the correct range. (No preservative was added)
PA = Original container checked - pH adjusted to correct range. (Preservative was added)
PV = Volatile container checked
PC = pH checked (unpreserved container)
SPK = Subsampled from an original container. Original container checked - pH is within correct range
SPA = Subsampled from an original container. Subsample container checked - pH adjusted to correct range.
SPC = Subsampled from an original container. pH checked (unpreserved container).
SUP = Subsampled from original container. Unable to be preserved due to the matrix of the sample.
UP = Unable to preserve due to matrix of the sample.
NA = Not applicable

00259 Mercury

The solution resulting from the mercury digestion is analyzed by Cold Vapor AA.

Reference: Test Methods for Evaluating Solid Wastes, SW-846 Method 7470A, September 1994

00159 Mercury

The solution resulting from the mercury digestion is analyzed by Cold Vapor AA.

Reference: Test Methods for Evaluating Solid Wastes, SW-846 Method 7471A, September 1994

01848 ICP-WW, 3005A (tot rec) - U3

The sample is digested with nitric acid and hydrochloric acid.

Reference: Test Methods for Evaluating Solid Wastes, SW-846 Method 3005A, July 1992

05713 WW SW846 Hg Digest

The sample is heated at 95 c with nitric acid, sulfuric acid, potassium persulfate, and potassium permanganate. Excess potassium permanganate is reduced with sodium chloride/hydroxylamine hydrochloride. Mercuric ions are reduced to mercury metal using stannous chloride.

Reference: Test Methods for Evaluating Solid Wastes, SW-846 Method 7470A, September 1994

05711 Hg-SW, 7471A - U3

The sample is heated at 95 c with nitric acid, sulfuric acid, potassium persulfate, and potassium permanganate. Excess potassium permanganate is reduced with sodium chloride/hydroxylamine hydrochloride. Mercuric ions are reduced to mercury metal using stannous chloride.

Reference: Test Methods for Evaluating Solid Wastes, SW-846 Method 7471A Modified, September 1994.

06935 Arsenic
06946 Barium
07046 Barium
07049 Cadmium
06949 Cadmium
06951 Chromium
07053 Copper
06953 Copper
06955 Lead
06936 Selenium
07066 Silver
06966 Silver
07072 Zinc
06972 Zinc

The solution resulting from the metals digestion is analyzed by Trace ICP.

Reference: Test Methods for Evaluating Solid Wastes, SW-846 Method 6010B, December 1996.

06025 Arsenic
06031 Chromium

06035 Lead
06041 Selenium

The solution resulting from the metals digestion is analyzed by ICP/MS.

Reference: Test Methods for Evaluating Solid Wastes, SW-846 Method 6020, September 1994.

05708 ICP-ICPMS - SW, 3050B - U3

The sample is digested with nitric acid, hydrochloric acid and hydrogen peroxide.

Reference: Test Methods for Evaluating Solid Wastes, SW-846 Method 3050B, December 1996

06050 ICPMS-Water, 3020A - U3

The sample is digested with nitric acid.

Reference: Test Methods for Evaluating Solid Wastes, SW-846 Method 3020A, July 1992

07807 BNA Water Extraction

The sample aliquot is extracted with methylene chloride by either separatory funnel or liquid/liquid apparatus. Extraction is performed at a pH of 2. The extract is concentrated prior to analysis.

Reference: Test Methods for Evaluating Solid Wastes, SW-846 Method 3510C, Rev 3, December 1996

10724 PAH 8270 (microwave)
07805 PAHs in Water by GC/MS

The sample extract is analyzed by capillary column Gas Chromatography/Mass Spectrometry.

Reference: Test Methods for Evaluating Solid Wastes, SW-846 Method 8270C, December 1996

10814 BNA Soil Microwave PAH

The sample aliquot is extracted using microwave extraction with 1:1 methylene chloride and acetone. The extract is concentrated prior to analysis.

Reference: Test Methods for Evaluating Solid Wastes, SW-846 Method 3546, Revision 0, February 2007.

13994 TOC Subcontracted - Spectrum

Total organic carbon is determined by acidifying a sample aliquot and heating it to remove any inorganic carbon. The sample is then heated to 900oC for combustion of the remaining organic carbon. The resulting carbon dioxide from the organic carbon is detected by a nondispersive infrared detector that has been calibrated to directly display the mass of carbon dioxide detected. The mass is proportional to the mass of total organic carbon in the sample.

Reference: Lloyd Kahn (modified)

00111 Moisture
00118 Moisture
00121 Moisture Duplicate
07400 Percent Solids

A well-mixed sample is placed in a tared container and dried to a constant weight in an oven at 103-105C. The increase in weight is the total solids.

Reference: Standard Methods for the Examination of Water and Wastewater, 20th Edition, 1998, Method 2540 G-1997

12815 Sample Decanting

Decanting is used to separate the liquid from an insoluble solid. As the solid settles to the bottom of the container, the liquid is carefully poured into another container leaving the solid behind.

Quality Control Summary

Client Name: The Johnson Company, Inc. Group Number: 1594773
Reported: 12/16/2015 08:46

Matrix QC may not be reported if insufficient sample or site-specific QC samples were not submitted. In these situations, to demonstrate precision and accuracy at a batch level, a LCS/LCSD was performed, unless otherwise specified in the method.

All Inorganic Initial Calibration and Continuing Calibration Blanks met acceptable method criteria unless otherwise noted on the Analysis Report.

Authorized by:

June O'Connor
Laboratory Director

Eurofins Spectrum Analytical holds certification in the State of New York for the analytes as indicated with an X in the "Cert." column within this report. Please note that the State of New York does not offer certification for all analytes. Please refer to our website for specific certification holdings in each state.
Please note that this report contains 7 pages of analytical data plus Chain of Custody document(s). When the Laboratory Report is indicated as revised, this report supersedes any previously dated reports for the laboratory ID(s) referenced above. Where this report identifies subcontracted analyses, copies of the subcontractor's test report are available upon request. This report may not be reproduced, except in full, without written approval from Eurofins Spectrum Analytical, Inc.

Eurofins Spectrum Analytical, Inc. is a NELAC accredited laboratory organization and meets NELAC testing standards. Use of the NELAC logo however does not insure that Spectrum is currently accredited for the specific method or analyte indicated. Please refer to our Quality web page at www.spectrum-analytical.com for a full listing of our current certifications and fields of accreditation. States in which Spectrum Analytical, Inc. holds NELAC certification are New York, New Hampshire, New Jersey, Pennsylvania and Florida. All analytical work for Volatile Organic and Air analysis are transferred to and conducted at our 830 Silver Street location (PA-68-04426).

Please contact the Laboratory or Technical Director at 800-789-9115 with any questions regarding the data contained in this laboratory report.

CASE NARRATIVE:

Data has been reported to the RDL. This report excludes estimated concentrations detected below the RDL and above the MDL (J-Flag).

All non-detects and all results below the reporting limit are reported as "<" (less than) the reporting limit in this report.

The samples were received -0.3 degrees Celsius, please refer to the Chain of Custody for details specific to temperature upon receipt. An infrared thermometer with a tolerance of +/- 1.0 degrees Celsius was used immediately upon receipt of the samples.

If a Matrix Spike (MS), Matrix Spike Duplicate (MSD) or Duplicate (DUP) was not requested on the Chain of Custody, method criteria may have been fulfilled with a source sample not of this Sample Delivery Group.

There is no relevant protocol-specific QC and/or performance standards non-conformances to report.

Notes and Definitions

dry	Sample results reported on a dry weight basis
NR	Not Reported
RPD	Relative Percent Difference

Laboratory Control Sample (LCS): A known matrix spiked with compound(s) representative of the target analytes, which is used to document laboratory performance.

Matrix Duplicate: An intra-laboratory split sample which is used to document the precision of a method in a given sample matrix.

Matrix Spike: An aliquot of a sample spiked with a known concentration of target analyte(s). The spiking occurs prior to sample preparation and analysis. A matrix spike is used to document the bias of a method in a given sample matrix.

Method Blank: An analyte-free matrix to which all reagents are added in the same volumes or proportions as used in sample processing. The method blank should be carried through the complete sample preparation and analytical procedure. The method blank is used to document contamination resulting from the analytical process.

Method Detection Limit (MDL): The minimum concentration of a substance that can be measured and reported with 99% confidence that the analyte concentration is greater than zero and is determined from analysis of a sample in a given matrix type containing the analyte.

Reportable Detection Limit (RDL): The lowest concentration that can be reliably achieved within specified limits of precision and accuracy during routine laboratory operating conditions. For many analytes the RDL analyte concentration is selected as the lowest non-zero standard in the calibration curve. While the RDL is approximately 5 to 10 times the MDL, the RDL for each sample takes into account the sample volume/weight, extract/digestate volume, cleanup procedures and, if applicable, dry weight correction. Sample RDLs are highly matrix-dependent.

Surrogate: An organic compound which is similar to the target analyte(s) in chemical composition and behavior in the analytical process, but which is not normally found in environmental samples. These compounds are spiked into all blanks, standards, and samples prior to analysis. Percent recoveries are calculated for each surrogate.

Continuing Calibration Verification: The calibration relationship established during the initial calibration must be verified at periodic intervals. Concentrations, intervals, and criteria are method specific.

SC13114 General Narrative

Eurofins Spectrum Analytical, Inc. submits the enclosed data package for the site characterization of See Chain of Custody. Samples submitted for analysis by Eurofins Lancaster Laboratories Environmental, LLC. Under this deliverable, analysis results are presented for four Sediment samples submitted on October 2nd, 2015.

The analyses were performed according to USEPA SW846 method analytical guidelines and other methods. In addition the analyses were performed according to criteria dictated by National Environmental Laboratory Accreditation Conference (NELAC) and in accordance with project contract requirements and chain of custody forms.

Observations and/or deviations observed for specific analyses can be found in the analysis narrative:

1. Overall Observations:

Where needed, manual integrations were performed to improve data quality. The corrections were reviewed and associated hardcopies generated and reported as required. Manual Integrations are coded to provide the data reviewer justification for such action. The codes are labeled on corresponding raw data for GC/MS and GC analysis as follows:

- M1 peak tailing or fronting
- M2 peak co-elution
- M3 rising or failing baseline
- M4 retention time shift
- M5 miscellaneous - under this category, the justification is explained
- M6 software did not integrate peak
- M7 partial peak integration

The enclosed report includes the originals of all data with the exception of logbook pages and certain initial calibrations. Scanned copies of logbook pages are included, with the originals are archived within the laboratory.

The pages in this report have been numbered consecutively, starting with the general narrative and ending with the page labeled as "Last Page of data Report".

I certify that this data package is in compliance with the terms and conditions of the contract, both technically and for completeness, for other than the conditions detailed above. Release of the data contained in this electronic data package, has been authorized by the laboratory director as verified by the following signature.

Nicole Leja Date: 10/22/2015

Laboratory Director

CASE NARRATIVE

Spectrum Analytical, Inc. Lab Reference No. SC13114

Client: Eurofins Lancaster Laboratories Environmental, LLC

Project: See Chain of Custody / 1594773

SDG #: 13114

I. RECEIPT

No exceptions were encountered unless a Sample Receipt Exception or a communication form is included in the addendum with this package.

II. HOLDING TIMES

All samples were prepared and analyzed within the method-specific holding time.

III. METHODS

Analyses were performed according to Lloyd Kahn.

IV. PREPARATION

Soil/Sediment samples were prepared according to General Preparation.

V. INSTRUMENTATION

The following equipment was used to analyze Lloyd Kahn:

TOC2 details: Teledyne Tekmar Apollo 9000 / TOC Boat Sampler Model 183

VI. ANALYSIS

A. Calibration:

All quality control samples were within the acceptance criteria.

B. Blanks:

All blanks were within the acceptance criteria.

C. Spikes:

1. Laboratory Control Samples (LCS):

All method criteria were met.

2. Matrix Spike / Matrix Spike Duplicate Samples (MS/MSD):

No matrix spike or matrix spike duplicates were analyzed.

3. Reference:

All method criteria were met.

D. Duplicates:

No client requested duplicate. However, the method criteria may have been fulfilled with non-SDG source samples.

E. Samples:

All method criteria were met.

Notes & Definitions

BRL Below the reporting limit and also indicates there are no detections between the MDL and MRL

Form I 'Q' column

B The analyte was found in the associated blank as well as the sample

D All identified compounds in the analysis are at a secondary dilution factor

E The identified compound's concentration exceeds the calibration range of the instrument for this specific analysis

J Compound detected but below the reporting limit and above the minimum detection limit (MDL); therefore, the result is an estimated concentration

N Included for TIC that indicates presumptive evidence of a compound

P Used for a Dual Column target analyte when the concentration difference between the two GC columns is greater than 40%.

U Compound was analyzed for but not detected

Form IIa 'Method' column

This column refers to the instrument used for analysis

IR Iris ICP
MS Thermo ICP/MS
AV Mercury analyzer

Form VI 'Q' column

***** indicates that:
Mean RF is above the value in the LIMIT column, or
Linear COD is below the value in the LIMIT column, or
Quad COD is below the value in the LIMIT column

Form VII 'Type' column

A average of response factor
L linear regression
Q quadratic equation

Form VIII 'Q' column for Inorganics

E The dilution analysis is not within a control limit of 10%, therefore a chemical or physical interference effect must be suspected

Explanation of Symbols and Abbreviations

The following defines common symbols and abbreviations used in reporting technical data:

RL	Reporting Limit	**BMQL**	Below Minimum Quantitation Level
N.D.	none detected	**MPN**	Most Probable Number
TNTC	Too Numerous To Count	**CP Units**	cobalt-chloroplatinate units
IU	International Units	**NTU**	nephelometric turbidity units
umhos/cm	micromhos/cm	**ng**	nanogram(s)
C	degrees Celsius	**F**	degrees Fahrenheit
meq	milliequivalents	**lb.**	pound(s)
g	gram(s)	**kg**	kilogram(s)
µg	microgram(s)	**mg**	milligram(s)
mL	milliliter(s)	**L**	liter(s)
m3	cubic meter(s)	**µL**	microliter(s)
		pg/L	picogram/liter

< less than

> greater than

ppm parts per million - One ppm is equivalent to one milligram per kilogram (mg/kg) or one gram per million grams. For aqueous liquids, ppm is usually taken to be equivalent to milligrams per liter (mg/l), because one liter of water has a weight very close to a kilogram. For gases or vapors, one ppm is equivalent to one microliter per liter of gas.

ppb parts per billion

Dry weight basis Results printed under this heading have been adjusted for moisture content. This increases the analyte weight concentration to approximate the value present in a similar sample without moisture. All other results are reported on an as-received basis.

Laboratory Data Qualifiers:

B - Analyte detected in the blank
C - Result confirmed by reanalysis
E - Concentration exceeds the calibration range
J (or G, I, X) - estimated value ≥ the Method Detection Limit (MDL or DL) and < the Limit of Quantitation (LOQ or RL)
P - Concentration difference between the primary and confirmation column >40%. The lower result is reported.
U - Analyte was not detected at the value indicated
V - Concentration difference between the primary and confirmation column >100%. The reporting limit is raised due to this disparity and evident interference…

Additional Organic and Inorganic CLP qualifiers may be used with Form 1 reports as defined by the CLP methods.
Qualifiers specific to Dioxin/Furans and PCB Congeners are detailed on the individual Analysis Report.

Analytical test results meet all requirements of the associated regulatory program (i.e., NELAC (TNI), DoD, and ISO 17025) unless otherwise noted under the individual analysis.

Measurement uncertainty values, as applicable, are available upon request.

Tests results relate only to the sample tested. Clients should be aware that a critical step in a chemical or microbiological analysis is the collection of the sample. Unless the sample analyzed is truly representative of the bulk of material involved, the test results will be meaningless. If you have questions regarding the proper techniques of collecting samples, please contact us. We cannot be held responsible for sample integrity, however, unless sampling has been performed by a member of our staff.

This report shall not be reproduced except in full, without the written approval of the laboratory.

Times are local to the area of activity. Parameters listed in the 40 CFR Part 136 Table II as “analyze immediately” are not performed within 15 minutes.

WARRANTY AND LIMITS OF LIABILITY - In accepting analytical work, we warrant the accuracy of test results for the sample as submitted. THE FOREGOING EXPRESS WARRANTY IS EXCLUSIVE AND IS GIVEN IN LIEU OF ALL OTHER WARRANTIES, EXPRESSED OR IMPLIED. WE DISCLAIM ANY OTHER WARRANTIES, EXPRESSED OR IMPLIED, INCLUDING A WARRANTY OF FITNESS FOR PARTICULAR PURPOSE AND WARRANTY OF MERCHANTABILITY. IN NO EVENT SHALL EUROFINS LANCASTER LABORATORIES ENVIRONMENTAL, LLC BE LIABLE FOR INDIRECT, SPECIAL, CONSEQUENTIAL, OR INCIDENTAL DAMAGES INCLUDING, BUT NOT LIMITED TO, DAMAGES FOR LOSS OF PROFIT OR GOODWILL REGARDLESS OF (A) THE NEGLIGENCE (EITHER SOLE OR CONCURRENT) OF EUROFINS LANCASTER LABORATORIES ENVIRONMENTAL AND (B) WHETHER EUROFINS LANCASTER LABORATORIES ENVIRONMENTAL HAS BEEN INFORMED OF THE POSSIBILITY OF SUCH DAMAGES. We accept no legal responsibility for the purposes for which the client uses the test results. No purchase order or other order for work shall be accepted by Eurofins Lancaster Laboratories Environmental which includes any conditions that vary from the Standard Terms and Conditions, and Eurofins Lancaster Laboratories Environmental hereby objects to any conflicting terms contained in any acceptance or order submitted by client.

See QC Reference List for Associated Batch QC Samples

SAMPLE RECEIPT:

Samples were received in good condition and within temperature requirements.

HOLDING TIME:

All holding times were met.

PREPARATION/EXTRACTION/DIGESTION:

No problems were encountered.

CALIBRATION/STANDARDIZATION:

All criteria were met.

QUALITY CONTROL AND NONCONFORMANCE SUMMARY:

All QC is within specification.

SAMPLE ANALYSIS:

No problems were encountered with the analysis of the samples.

4,6-Dinitro-2-methylphenol and 4-Nitrophenol are at 10 ng/ul in the 5 standard.
Benzidine Levels in the 5,15,30,50,80,120 standards are 15,45,90,150,240,360 ng/ul, respectively.
Benzoic acid and 2,4-Dinitrophenol are at 15 ng/ul, 30 ng/ul,40 ng/ul in the 5,15,30 standards.

Average %RSD 5

4,6-Dinitro-2-methylphenol and 4-Nitrophenol are at 10 ng/ul in the 5 standard.
Benzidine Levels in the 5,15,30,50,80,120 standards are 15,45,90,150,240,360 ng/ul, respectively.
Benzoic acid and 2,4-Dinitrophenol are at 15 ng/ul, 30 ng/ul,40 ng/ul in the 5,15,30 standards.

** indicates the Mid Level Calibration Standard.

Mid Level Calibration Standard is used for comparison.

Current Continuing Calibration Standard:

/chem/HP19760.i/15sep29.b/di0821.d

Area Summary

Internal Standard Name	File ID: di0821.d	ICAL Area	Low Limit	High Limit	In Spec
1,4-Dichlorobenzene-d4	256715	222949	111474	445898	Yes
Naphthalene-d8	958476	857183	428592	1714366	Yes
Acenaphthene-d10	563091	490402	245201	980804	Yes
Phenanthrene-d10	1010368	850565	425282	1701130	Yes
Pyrene-d10	1297152	1104282	552141	2208564	Yes
Perylene-d12	1150209	935614	467807	1871228	Yes

A "No" indicates the internal standard area is outside acceptable QC limits.

RT Summary

Internal Standard Name	File ID: di0821.d	ICAL RT	In Spec	
1,4-Dichlorobenzene-d4	6.160	6.936	No	*
Naphthalene-d8	8.090	8.871	No	*
Acenaphthene-d10	10.870	11.652	No	*
Phenanthrene-d10	12.846	13.534	No	*
Pyrene-d10	14.682	15.522	No	*
Perylene-d12	19.024	20.022	No	*

A "No" indicates the retention time is greater than 30 seconds from the RT of the referenced standard.

** indicates the Mid Level Calibration Standard.

Mid Level Calibration Standard is used for comparison.

Current Continuing Calibration Standard:

/chem/HP09910.i/15sep23a.b/oi1061.d

Area Summary

File ID:

Internal Standard Name	oi1061.d	ICAL Area	Low Limit	High Limit	In Spec
1,4-Dichlorobenzene-d4	194119	148855	74428	297710	Yes
Naphthalene-d8	891558	699436	349718	1398872	Yes
Acenaphthene-d10	553038	437487	218744	874974	Yes
Phenanthrene-d10	1045741	865313	432656	1730626	Yes
Pyrene-d10	1131523	1011712	505856	2023424	Yes
Perylene-d12	831712	755977	377988	1511954	Yes

A "No" indicates the internal standard area is outside acceptable QC limits.

RT Summary

File ID:

Internal Standard Name	oi1061.d	ICAL RT	In Spec
1,4-Dichlorobenzene-d4	6.540	6.640	Yes
Naphthalene-d8	7.816	7.916	Yes
Acenaphthene-d10	9.557	9.657	Yes
Phenanthrene-d10	11.016	11.122	Yes
Pyrene-d10	12.416	12.516	Yes
Perylene-d12	15.133	15.262	Yes

A "No" indicates the retention time is greater than 30 seconds from the RT of the referenced standard.

Target Revision 3.5

Data File: /chem/HP09910.i/15sep25a.b/oi1186.d Instrument ID: HP09910.i
Injection date and time: 26-SEP-2015 07:04 Analyst ID: ceb05247

Method used: /chem/HP09910.i/15sep25a.b/m8270c.m Sublist used: 4676
Calibration date and time: 25-SEP-2015 20:56
Date, time and analyst ID of latest file update: 27-Sep-2015 14:58 lmh00956

Sample Name: PS485 Lab Sample ID: 8057367

Compounds	I.S. Ref.	RT	QIon	Area	On-Column Amount (ng/ul)
25)*1,4-Dichlorobenzene-d4	(1)	6.439	152	201393	20.000
44)$Nitrobenzene-d5	(2)	7.004	82	1962203	89.021
65)*Naphthalene-d8	(2)	7.716	136	947195	20.000
66) Naphthalene	(2)	7.739	128	9570M	0.183
83) 2-Methylnaphthalene	(2)	8.422	142	7383	0.201
93)$2-Fluorobiphenyl	(3)	8.798	172	3286561	94.623
109) Acenaphthylene	(3)	9.310	152	17943M	0.369
113)*Acenaphthene-d10	(3)	9.451	164	547201	20.000
114) Acenaphthene	(3)	9.480	153	3690M	0.110
126) Fluorene	(3)	9.992	166	5539M	0.143
153)*Phenanthrene-d10	(4)	10.910	188	908579	20.000
155) Phenanthrene	(4)	10.933	178	39330	0.745
157) Anthracene	(4)	10.980	178	19165	0.368
173) Fluoranthene	(4)	12.110	202	111483	1.944
175)*Pyrene-d10	(5)	12.310	212	876575	20.000
177) Pyrene	(5)	12.327	202	111379M	2.130
179)$Terphenyl-d14	(5)	12.492	244	2997577	92.921
195) Benzo(a)anthracene	(5)	13.527	228	37617	0.825
196) Chrysene	(5)	13.562	228	64070	1.475
206) Benzo(b)fluoranthene	(6)	14.621	252	80923M	2.083
208) Benzo(k)fluoranthene	(6)	14.645	252	33058M	0.834
211) Benzo(a)pyrene	(6)	14.945	252	38333M	0.999
213)*Perylene-d12	(6)	15.004	264	619114	20.000
219) Indeno(1,2,3-cd)pyrene	(6)	16.227	276	35047M	0.877
220) Dibenz(a,h)anthracene	(6)	16.251	278	5775M	0.172
221) Benzo(g,h,i)perylene	(6)	16.586	276	37375M	1.138

M = Compound was manually integrated.
* = Compound is an internal standard.
$ = Compound is a surrogate standard.
