Target Revision 3.5

Data File: /chem/HP20296.i/15oct17.b/lj0622.d Instrument ID: HP20296.i
Injection date and time: 17-OCT-2015 17:59 Analyst ID: ceb05247

Method used: /chem/HP20296.i/15oct17.b/rv8270c.m Sublist used: 4656
Calibration date and time: 17-OCT-2015 13:10
Date, time and analyst ID of latest file update: 17-Oct-2015 18:23 Unknown

Sample Name: P2908 Lab Sample ID: 8082130

Compounds	I.S. Ref.	RT	QIon	Area	On-Column Amount (ng/ul)
25)*1,4-Dichlorobenzene-d4	(1)	7.001	152	196159	5.000
44)$Nitrobenzene-d5	(2)	7.862	82	1688453	21.856
65)*Naphthalene-d8	(2)	8.990	136	765205	5.000
93)$2-Fluorobiphenyl	(3)	10.777	172	2279498	19.662
113)*Acenaphthene-d10	(3)	11.820	164	420552	5.000
153)*Phenanthrene-d10	(4)	13.751	188	758951	5.000
175)*Pyrene-d10	(5)	15.821	212	853400	5.000
179)$Terphenyl-d14	(5)	16.136	244	2237082	19.741
213)*Perylene-d12	(6)	20.431	264	617858	5.000

* = Compound is an internal standard.
$ = Compound is a surrogate standard.

SAMPLE RECEIPT:

Samples were received in good condition and within temperature requirements.

HOLDING TIME:

All holding times were met.

PREPARATION/EXTRACTION/DIGESTION:

No problems were encountered.

CALIBRATION/STANDARDIZATION:

All criteria were met.

QUALITY CONTROL AND NONCONFORMANCE SUMMARY:

All QC is within specification.

SAMPLE ANALYSIS:

No problems were encountered with the analysis of the samples.

The instrument detection limits (IDLs) are used for determining the U flags on the initial and continuing calibration blanks. The highest IDL is selected when multiple

ICP-AES Run Data Report

Reviewed By
Elaine F Stoltzfus

Reviewed Date
10/16/2015 7:42PM

Data File Name 1528909T73.TXT
Run Name: 1528909T73

Method Reference Name(s):

Verified By:
Deborah A Krady

Verified Date
10/20/2015 8:41AM

Analyst Employee: 0463

Instrument Parameters:

Individual Integration Time: 10.00 sec Total Integration Time: 30.00 sec Rinse Time: 15.00 sec

Element	Analyte Name	Wavelength Value
AG	Silver	328.06
AL	Aluminum	308.21
AS	Arsenic	189.04
AU	Gold	242.80
B	Boron	249.67
BA	Barium	455.40
BE	Beryllium	313.04
CA	Calcium	317.93
CD	Cadmium	226.50
CO	Cobalt	228.62
CR	Chromium	267.72
CU	Copper	327.40
FE	Iron	261.19
K	Potassium	766.49
LI	Lithium	670.78
MG	Magnesium	285.21
MN	Manganese	257.61
MO	Molybdenum	202.03
NA	Sodium	589.59
NI	Nickel	231.60
P	Phosphorus	177.49
PB	Lead	220.35
SB	Antimony	206.83
SE	Selenium	196.09
SI	Silicon	251.60
SN	Tin	189.99
SR	Strontium	421.55
TE	Tellurium	214.28
TH	Thorium	401.91
TI	Titanium	334.94
TL	Thallium	190.86
V	Vanadium	292.40
W	Tungsten	207.91
Y1	Yttrium	224.31
Y2	Yttrium	371.03
ZN	Zinc	213.86
ZR	Zirconium	339.19

The TRACE ICP utilizes Yttrium as an internal standard to compensate for fluctuations in nebulization and plasma conditions. All Yttrium readings are expressed in counts.

ICP-MS Run Data Report

Method Reference Name(s):

Date File Name: 15J20F00.E03

Run Name: 1529305E03

Analyst: 1242

Reviewed By: Choon Y Tian

Reviewed Date: 10/20/2015 11:22

Verified By: Deborah A Krady

Verified Date: 10/20/2015 11:33

Instrument Parameters:

Rinse Time (sec): 25.00

Instrument Tuning Report (ICPMS #11332)

File Name: default.tun

File Path: C:\elandata\Tuning

Sample Date/Time: 10/20/2015 3:11:00AM

Number of Replicates: 6

Method File: c:\elandata\Method\dailytune.mth

Measured Mass must be within +/- 0.1 amu of the Exact Mass.

Measured Peak Width must be > or = to 0.640 AND < or = to 0.660.

DATA VALIDATION REPORTS AND RELATED QA/QC CORRESPONDENCE AND DOCUMENTATION

Phoenix Chemistry Services

December 16, 2015

Guy Vaillancourt
Project Manager, Pine Street Canal Site
The Johnson Company
100 State Street, Suite 600
Montpelier, VT 05602

Reference #: 2015-1123-001

Dear Guy,

Enclosed please find the results of the data validation of Sample Delivery Group (SDG) Nos. PSC24 and PSC27 from the Compliance Monitoring work at the Pine Street Canal Site, in Burlington, VT. The sediment samples and field blanks in these SDGs were collected on September 21-24, 2015. The laboratory analyses were performed by Eurofins Lancaster Laboratories of Lancaster, PA , and the Total Organic Carbon (TOC) analyses were performed by Eurofins Spectrum Analytical of Agawam, MA under sub-contract to Eurofins Lancaster.

The original data packages were received on November 23, 2015; a revision containing missing documents for the TOC analyses was received on December 8, 2015, and a full revision of the TOC results for both data packages was received on December 16, 2015. The validation has been performed by Phoenix Chemistry Services, according to the Tier II guidelines as defined by USEPA Region I, to maintain consistency with previous site work, as presented in "Region I EPA-NE Data Validation Functional Guidelines for Evaluating Environmental Analyses", Parts I-III, December, 1996, and Part IV, November, 2008. The EPA's National Functional Guidelines for Organic Data Review (EPA 540/R-99/008, October, 1999), EPA's National Functional Guidelines for Inorganic Data Review (EPA 540-R-04-004, October 2004), and The Johnson Company's 2006 Quality Assurance Project Plan (QAPP), Rev. 5, were also considered during the evaluation, and professional judgment was applied as necessary and appropriate. Most of the TOC validation was raised to a Tier III when the validator and project Quality Assurance Officer questioned the original results. All issues have now been addressed, and the revisions received should be used in place of the corresponding sections of the original data packages. These issues are detailed within the validation report for TOC. Data qualifiers have been applied in the final validation report as necessary and appropriate, in accordance with these guidelines.

No sediment samples exhibited percent solids content less than 20 percent, and based on the approval of the original QAPP for this project, no qualifications were applied for sediment samples exhibiting percent solids between 20% and 30%.

Thank you for this opportunity to provide data validation services to The Johnson Company. We look forward to continuing to work with you on this and other projects. If there are any questions or concerns about the material in this report, please do not hesitate to contact me for help and clarification.

Sincerely,

Deborah H. Gaynor, Ph.D.
Principal, Phoenix Chemistry Services

SVOA Validation Report/PSC24_27/dal/dhg

EXECUTIVE SUMMARY

Phoenix Chemistry Services (Phoenix) has completed the validation of Polynuclear Aromatic Hydrocarbon (PAH) analysis data prepared by Eurofins Lancaster Laboratories for 23 sediment samples and 4 field blanks (FBs) from the Pine Street Canal Site in Burlington, VT. The laboratory reported the data under Sample Delivery Group (SDG) Nos. PSC24 and PSC27, which were submitted as two data packages received by Phoenix on November 23, 2015, and which include the following samples:

Sample Location Identifier (SLID)	Sample Identifier Number (SIN)	Laboratory ID
SDG No. PSC24		
J_T2+00E100 (0-10 cm)	0481-13	8057359
J_T2+00E100 (11-22 in)	0482-13	8057360
J_T3+00E100 (0-10 cm)	0483-13	8057361

J_T17+00E400 (0-10 cm)	0497-13	8064470
J_0161-13FB	0161-13 FB	8064471

A cross-reference of sample IDs was provided in both data packages. The samples in this data set represent the sample collections from September 21-24, 2015. Samples collected on September 21, 2015 were shipped overnight to the laboratory for receipt on September 22, 2015. Samples collected on September 22, 23,

and 24, 2015 were shipped overnight on September 24, 2015 to the laboratory for receipt on September 25, 2015.

Results for PAH compounds were determined to be valid as reported for all samples in SDG Nos. PSC24 and PSC25, with the following qualifications and observation:

- Results for pyrene, acenaphthylene, phenanthrene, fluoranthene, benzo(a)anthracene, chrysene, benzo(b)fluoranthene, benzo(k)fluoranthene, benzo(a)pyrene, indeno(1,2,3-cd)pyrene, and benzo(g,h,i)perylene in 0493-13 and 0164-13 DP were qualified as estimated (J). Acenaphthylene in sample 0493-13 was already estimated (J) as it was detected below the sample specific Practical Quantitation Limit (PQL).

- The laboratory appropriately applied "J" qualifiers to the sample results when the concentration of an analyte was less than the sample-specific PQL.

The Overall Evaluation of Data (Section XVI) summarizes the validation results. The validation findings and conclusions for each analytical parameter are detailed in the remaining sections of this report.

Documentation problems observed in the data packages are described in Section XVII.

This validation report shall be considered part of the data packages for all future distributions of the polynuclear aromatic hydrocarbons (PAH) analysis data.

INTRODUCTION

Analyses were performed according to SW-846 Method 8270C, as documented in Eurofins Lancaster Laboratories SOP No. 09491309_13_8270C. The target compound list for semivolatiles was limited to the following 17 polynuclear aromatic hydrocarbon (PAH) compounds:

Naphthalene	Benzo(a)anthracene
2-Methylnaphthalene	Chrysene
Acenaphthylene	Benzo(b)fluoranthene
Acenaphthene	Benzo(k)fluoranthene
Fluorene	Benzo(a)pyrene
Phenanthrene	Indeno(1,2,3-cd)pyrene
Anthracene	Dibenz(a,h)anthracene
Fluoranthene	Benzo(g,h,i)perylene
Pyrene	

Tentative identification of non-target analyte peaks (i.e., tentatively identified compounds, or TICs) was not requested for these analyses.

Phoenix Chemistry Services' validation was performed in conformance with Tier II guidelines as defined by USEPA Region I. Data qualifiers are applied as necessary and appropriate. To the extent possible and to maintain consistency with previous work at this site, the data were evaluated in accordance with the "Region I EPA-NE Data Validation Functional Guidelines for Evaluating Environmental Analyses", December, 1996. The Quality Assurance Project Plan (QAPP; The Johnson Company, Revision 5, December, 2006) and EPA's National Functional Guidelines for Organic Data Review (EPA 540/R-99/008, October, 1999) were also considered during the evaluation, and professional judgment was applied as necessary and appropriate.

The data validation process evaluates data on a technical basis for chemical analyses conducted under the CLP or other well-defined methods. Contract compliance is evaluated only in specific situations. Issues pertaining to contractual compliance are noted where applicable. It is assumed that the data packages are presented in accordance with the CLP (CLP-like or SW-846) requirements. It is also assumed that the data packages represents the best efforts of the laboratory and has already been subjected to adequate and sufficient quality review prior to submission for validation. In instances where SW-846 or other specific methods have been used for the analyses, the validation effort is modified to acknowledge the differences in methodology while maintaining the goals and quality objectives of the CLP.

Results of sample analyses are reported by the laboratory as either qualified or unqualified; various qualifier codes are used by the laboratory to denote specific information regarding the analytical results. During the validation process, laboratory data are verified against all available supporting documentation. Based on this evaluation, qualifier codes may be added, deleted or modified by the data validator. Validated results are either qualified or unqualified; if results are unqualified, this means that the reported values may be used without reservation. Final validated results are annotated with the following codes, as defined in the EPA Region I Functional Guidelines:

U - The analyte was analyzed for, but was not detected. The associated numerical value is the

sample quantitation limit. The sample quantitation limit accounts for sample specific dilution factors and percent solids corrections or sample sizes that deviate from those required by the method.

J - The associated numerical value is an estimated quantity.

UJ - The analyte was analyzed for, but was not detected. The sample quantitation limit is an estimated quantity.

R - The data are unusable (analyte may or may not be present). Resampling and reanalysis is necessary for verification. The R replaces the numerical value or sample quantitation limit. In some instances (e.g., a dilution) a result may be indicated as "rejected" to avoid confusion when a more quantitatively accurate result is available.

EB, TB, BB - An analyte that was identified in an aqueous equipment (field) blank, trip blank, or bottle blank that was used to assess field contamination associated with soil/sediment samples. These qualifiers are to be applied to soil/sediment sample results only.

These codes (qualifiers) are assigned during the validation process and are based on the data review of the results. They are recorded in the Data Summary Table contained in Attachment A and the spreadsheet summary files in Attachment B (submitted electronically) of this validation report.

All data users should note two facts. First, **the "R" qualifier means that the laboratory-reported value is completely unusable.** The analysis is invalid due to significant quality control problems, and provides no information as to whether the compound is present or not. Rejected values should not appear on data tables because they have no useful purpose under any circumstances. Second, **no analyte concentration is guaranteed to be accurate even if all associated quality control is acceptable.** While strict quality control conformance provides well-defined confidence in the reported results, any analytical result will always contain some error.

The user is also cautioned that the validation effort is based on the materials provided by the laboratory. Software manipulation, resulting in misleading raw data printouts, cannot be routinely detected during validation; unless otherwise stated in the report, these kinds of issues are outside the scope of this review.

Detailed Findings of Measurement Error Associated with the Analytical Analysis

I. Preservation and Technical Holding Times (Sample Integrity)

The samples for semivolatile analysis in SDG Nos. PSC24 and PSC27 were collected on September 21-24, 2015, and received by the laboratory on Sep. 22 and 25, 2015. All extractions were performed within the acceptable holding times for water (7 days from collection) and soil/sediment (14 days from collection) samples. The sample extracts were also analyzed within 40 days of extraction, as required by Region 1.

The temperature blanks of the coolers on receipt at the laboratory were checked and documented in the data packages to be within or just below the acceptable range of 4 ^{o}C ±2°C at 1.0, 1.5, 4.7, and 1.9^{o}C. Since temperatures were within or slightly below the acceptance range, and the laboratory did not note the presence of ice in any sample, all sample temperatures were deemed acceptable.

II. GC/MS Instrument Performance Check (Tuning)

The samples were analyzed on three GC/MS systems identified as instruments HP19760, HP18444, and HP09910. The tuning of these instruments was demonstrated with analysis of decafluorotriphenylphosphine (DFTPP); tunes were analyzed for each shift (12-hour period) during which the samples or associated standards were analyzed. All nine (9) DFTPP tunes were within acceptance limits, and are reported on the Form 5 summaries in the data packages, with the exception of the DFTPP analyzed on 10/5/15 on Instrument HP09910, for which a Form 5 summary was not provided. The raw data for this DFTPP was included in the data package. This was reviewed and was within acceptance limits.

III. Initial Calibration (IC)

One IC (8/13-14/2015) was performed on instrument HP19760, one IC (9/22/15) was performed on instrument HP09910, and one IC (9/23/15) was performed on instrument HP18444 in support of the sample analyses reported in these data packages. The ICs were performed at eight concentration levels (0.5, 1, 5, 15, 30, 50, 80, and 120 ug/L for sediments and 0.125, 0.25, 1.25, 3.75, 7.5, 12.5, 20, and 30 ug/L for field blanks) for the 17 target analytes. Relative response factor (RRF) as well as percent relative standard deviation (%RSD) values were reported on the Form 6 summaries. One independent calibration verification (ICV) standard, as required by the method, was analyzed after each initial calibration and reported in the data packages. Standards at the nominal method detection limit (0.5 ug/L for non-target analytes and 0.1 ug/L for target analytes for soils and 0.125 ug/L for non-target analytes and 0.025 ug/L for target analytes for field blanks) were also analyzed immediately following each IC as sensitivity checks.

All RRFs were above the 0.05 minimum technical criterion and all %RSDs were below the maximum limit (30%) specified by Region I, and were also below the method limit of 15%. Recoveries of target compounds in the ICVs were within laboratory established acceptance limits (80 – 120 % recovery).

IV. Continuing Calibration (CC)

One continuing calibration (CC) standard was analyzed on instrument HP19760, four CC standards were analyzed on instrument HP09110, and one CC standard was analyzed on instrument HP18444 in support of the sample analyses reported in these data packages. The RRF as well as percent difference (%D) values for all CC standards were reported on the Form 7 summaries within the data packages, with the exception of the CC analyzed on 10/5/15 on Instrument HP09910, for which a Form 7 summary was not provided. The raw data for this CC was included in the data package. This was reviewed and was within acceptance limits.

All RRFs were above the 0.05 minimum criterions, and all %D results were below the maximum limit (25%) in the indicated CC standards.

It should be noted that negative % Difference values will result in a low bias for positive detects, and a positive % Difference will result in a high bias for positive detects.

V. Blanks

Results for two water-matrix and two solid-matrix laboratory method blanks (MBs) were reported in association with this set of samples. No PAH compounds were detected in any MB.

Four sediment collection field blanks (FBs) were reported in these SDGs; no PAH compounds were detected in any FB.

VI. Surrogate Compounds

Percent recoveries (%R) for three surrogate compounds are reported on the Form 2 summaries within the data packages, and are within acceptance limits for all sample analyses

All surrogate standards are spiked into samples during extraction, however, only the three surrogate standards associated with PAH target analytes are reported in the summary forms.

VII. Internal Standards (IS)

All internal standard (IS) areas and retention times (RT) for the six IS were within the established QC limits for all reported sample analyses in these data packages. The internal standard summary form (Form 8) was not included for the sequence analyzed on 10/5/15 on Instrument HP09910. The raw data was reviewed and the IS areas in this sequence were found to be acceptable.

VIII. Matrix Spike/Matrix Spike Duplicate (MS/MSD)

Samples 0484-13 and 0494-13 were used for the sediment MS/MSD analyses. The spiking solution contained all 17 PAH compounds. Percent recoveries (%R) and relative percent differences (%RPD) between paired recoveries were reported on the Form 3 summaries for the spiked analytes. Recoveries (%R) of all

target analytes and relative percent difference (RPD) values were within (overall, 84 – 105 %R; 0 - 6 %RPD) established QC limits (76 – 129 %R) for both MS/MSD paired analyses.

IX. Field Duplicates

The following samples were identified as field duplicate pairs:

Parent	Duplicate	matrix
0483-13	0163-13 DP	sediment
0493-13	0164-13 DP	sediment

All target analytes except acenaphthene, anthracene, dibenz(a,h)anthracene, fluorene, 2-methylnaphthalene, and naphthalene were reported in both sample 0483-13 and its field duplicate 0163-13. Acenaphthylene was reported below the sample specific PQL in the parent sample and not detected in the field duplicate. Results for all detected analytes were below twice the sample specific PQL in both members of this field duplicate pair, so precision could not be evaluated for the less concentrated analytes in these field duplicates.

All target analytes except acenaphthene and fluorene were reported in both sample 0493-13 and its field duplicate 0164-13 DP. Naphthalene and 2-methylnaphthalene were reported below the sample specific PQL in the field duplicate and not detected in the parent sample. Target analytes pyrene, fluoranthene, chrysene, benzo(b)fluoranthene, benzo(a)pyrene, and benzo(g,h,i)perylene were reported at greater than twice the sample specific PQL in both members of the field duplicate pair. Target analytes acenaphthylene, phenanthrene, benzo(a)anthracene, benzo(k)fluoranthene, and indeno(1,2,3-cd)pyrene were reported at greater than twice the sample specific PQL in field duplicate only. Precision exceeded criteria (>50% RPD) for all analytes above twice the quantitation limit in both members of the field duplicate pair.

On the basis of the unacceptable precision in the field duplicate pair, results for pyrene, acenaphthylene, phenanthrene, fluoranthene, benzo(a)anthracene, chrysene, benzo(b)fluoranthene, benzo(k)fluoranthene, benzo(a)pyrene, indeno(1,2,3-cd)pyrene, and benzo(g,h,i)perylene in 0493-13 and 0164-13 DP were qualified as estimated (J). Acenaphthylene in sample 0493-13 was already estimated (J) as it was detected below the sample specific PQL.

X. Sensitivity Check

The aqueous MDL study submitted for this project was performed on 1/30/12, which is more than one year prior to these analyses. An updated MDL study or LOQ verification study was not requested. All project analytes had calculated MDL's below the method quantitation limits. The reporting limit is supported by the low standard of the IC as well as the MDL check standards analyzed with the ICs.

XI. Performance Evaluation (PE) Samples/Accuracy Check

Two (2) aqueous and two (2) solid matrix zero blind PE samples (commonly known as laboratory control samples, LCSs) were prepared at the same concentration level as the mid-point standard, and analyzed

by the laboratory in support of these samples. Percent recoveries were reported on the Form 3 summaries in the data packages, and were within (overall, aqueous, 71 – 115% and solid, 89 - 108 %R) established QC limits (laboratory limits: aqueous, 69 - 127 %R and solid, 76 – 129 %R; Region 1 limits: 60 - 140 %R) for all spiked analytes.

No external single-blind PES sample was required or submitted with the samples in this data set.

XII. Target Compound Identification

Target compound identification is not evaluated in a Tier II validation assessment.

XIII. Compound Quantitation and Reported Quantitation Limits

Practical quantitation limits (PQLs) were reported on the Form I summaries on a dry weight basis, as requested; the PQLs and MDLs (also reported on the Form 1 summaries) were adjusted for the sample weight or volume extracted, and for the measured percent moisture content in the sediment samples. Compound quantitation is not evaluated in a Tier II validation assessment. Sample decanting logbooks were not included in the data package.

Samples 0497-13 and 0499-13 were analyzed at 5-fold dilutions. In sample 0497-13, all analytes were detected, however, acenaphthene, naphthalene, acenaphthylene, fluorene, anthracene, dibenz(a,h)anthracene, and 2-methylnaphthalene were detected below the sample specific PQL and estimated (J). In sample 0499-13, acenaphthene, naphthalene and 2-methylnaphthalene were not detected and elevated sample specific PQLs were provided for these analytes. Acenaphthylene, fluorene, anthracene, and dibenz(a,h)anthracene were detected below the sample specific PQL and estimated (J). All other analytes were reported without qualification in both samples. There were no compounds in the samples that required dilution for quantification within calibration range, and there were no non-target interferences apparent in the sample analysis. The reasons for the dilutions were not noted in the project narrative.

Both of these samples also had high moisture content; sample 0497-13 exhibited 70.7 % moisture (29.3 % solids) content and sample 0499-13 exhibited 72.0 % moisture content (28.0 % solids). In keeping with previous project work, no qualifications were applied on the basis of the percent solids less than 30% but greater than 10%.

The laboratory appropriately applied “J” qualifiers to the sample results when the concentration of an analyte was less than the sample-specific PQL. The validator did not remove these qualifiers.

The values that the validator has judged to be acceptable are presented in the “Result” column in the Data Summary Table in Attachment A and in the “Validator_Result” column in the spreadsheet summary file submitted electronically as Attachment B. The final qualifiers based on the validation effort are presented in the “Validator_Qualifier” column in the Data Summary Table and in the spreadsheet summary file. All results, positive and non-detect, are listed in the these summaries, whether or not the value or qualifier was changed as a result of the validation; if a value or qualifier was changed, this is indicated by the “Y” (for yes) notation in the column “Validator_Change” in the Data Summary Table. A brief explanation of the reason for the validation change is coded in the “Validator_Reason” column in the Data Summary Table and the full

spreadsheet summary file; the definitions of these codes are given at the end of the Data Summary Table and on a separate tab of the spreadsheet file. Sample-specific PQLs are given in the summaries.

It should be noted that for sediments, percent moisture was measured after decanting. All samples were extracted at approximately the weight described in the method and the laboratory SOP. Therefore, the additional column labeled "Prep_Factor" added during validation was not required for this sample set, and has not been added.

XIV. Tentatively Identified Compounds (TICs)

Evaluation of unidentified, non-target analyte peaks was not requested or performed for these samples.

XV. System Performance

Analytical system performance is not evaluated in a Tier II validation assessment.

XVI. Overall Evaluation of Data

Results for PAH compounds were determined to be valid as reported for all samples in SDG Nos. PSC24 and PSC27, with the following qualifications and observation:

- On the basis of the unacceptable precision in the field duplicate pair, results for pyrene, acenaphthylene, phenanthrene, anthracene, fluoranthene, benzo(a)anthracene, chrysene, benzo(b)fluoranthene, benzo(k)fluoranthene, benzo(a)pyrene, indeno(1,2,3-cd)pyrene, and benzo(g,h,i)perylene in 0493-13 and 0164-13 DP were qualified as estimated (J). Acenaphthylene in sample 0493-13 was already estimated (J) as it was detected below the sample specific PQL.

- The laboratory appropriately applied "J" qualifiers to the sample results when the concentration of an analyte was less than the sample-specific PQL.

Documentation problems observed in the data packages are described in Section XVII.

XVII. Documentation

Chain-of-custody (COC) records were present and completed accurately.

Data presentation was acceptable, with the following observations and exceptions:

- Decanting logs were not included in either data package.

- Forms 5B (DFTPP), Form 7C (CC) and Form 8 (IS) were not included in the data package for the sequence analyzed on 10/5/15 on Instrument HP 09910. The raw data for these analyses

were included and review and calculations of the raw data were performed in validation to ensure that appropriate criteria were met.

The missing documentation has been requested from the laboratory, and should be maintained in Appendix C of this report upon receipt.

This validation report should be considered part of the data packages for all future distributions of the PAH analysis data.

Metals Validation Report/PSC24_27/kbw/dhg

EXECUTIVE SUMMARY

Phoenix Chemistry Services (Phoenix) has completed the validation of the inorganic (total metals) analysis data by Eurofins Lancaster Laboratories in Lancaster, PA for 23 sediment samples and 4 (water) Field Blanks (FB) from the Pine Street Canal Site in Burlington, VT. The laboratory reported the data under Sample Delivery Group (SDG) Nos. PSC24 and PSC27, which were submitted as two data packages received by Phoenix on November 23, 2015, and which include the following samples:

Sample Location Identifier (SLID)	Sample Identifier Number (SIN)	Laboratory ID
SDG No. PSC24		
J_T2+00E100 0-10 cm	0481-13	8057359
J_T2+00E100 11-22 cm	0482-13	8057360

A cross-reference of sample IDs was provided in the data packages. The samples in this data set represent the sample collections from September 21-24, 2015; each day the samples were shipped overnight to the laboratory and were received the next day with the exception of samples collected on September 22 and 23, which were shipped on September 24 and received on September 25, 2015.

Based on the validation effort, results for the inorganic analytes in all samples were determined to be valid as reported with the following exception and observation:

- Results for arsenic and selenium reported in all samples below their respective LOQs were qualified as less than the LOQ (U). Field blanks were not qualified based on laboratory blank contamination.

- Results for cadmium and mercury reported in all samples below their respective LOQs were qualified as less than the LOQ (U). Field blanks were not qualified based on laboratory blank contamination.

- Results for barium, copper, and chromium in all samples in SDG No. PCS27 were qualified as estimated (J).

- The laboratory reported all results to the LOQ or RL on the analysis reports in the analysis results section of the data package; however, target compounds detected in the associated samples below the LOQ but greater than the MDL (as reported on the Form 10) were reported on the Form Is with a "J" (estimated) qualifier. The "J" qualifiers were not removed by the validator, unless previously qualified based on laboratory or field blank contamination. Analysis Form 1s included in the metals section of the data packages used "B" qualifiers for values less than the LOQs. These Form 1s were disregarded in the validation effort since the laboratory also reported results with a non-detect to the MDL. As stated in the case narratives, the IDLs are used for determining the U flags (non-detects) on the initial and continuing calibration blanks. The highest IDL is selected when multiple instruments are used for an analysis. The MDLs are used for determining all other U flags.

The Overall Evaluation of Data (Section XIII) summarizes the validation results. The validation findings and conclusions for each analytical parameter are detailed in the remaining sections of this report.

Documentation problems (exceptions) observed in the data packages are described in Section XIV.

This validation report shall be considered part of the data packages for all future distributions of the inorganics (total metals) data.

INTRODUCTION

Analyses for ICP metals were performed according to SW-846 Method 6010B (digestion 3005A and 3050A) and 6020A waters (digestion 3020A) for selected metals, mercury was performed by methods 7470A (mercury in water) and 7471 (mercury in soil). The target compound list for metals was limited to the following 10 metals:

Arsenic	Barium
Cadmium	Chromium
Copper	Lead
Mercury	Zinc
Selenium	Silver

Phoenix Chemistry Services' validation was performed to the extent possible in conformance with Tier II guidelines as defined by USEPA Region I. Data qualifiers are applied as necessary and appropriate. The data were evaluated in accordance with the "Region I EPA-NE Inorganic Data Validation Functional Guidelines" (11/2008). EPA's National Functional Guidelines for Inorganic Data Review (EPA 540-R-04-004, October 2004) were also considered during the evaluation, and professional judgment was applied as necessary and appropriate.

The data validation process evaluates data on a technical basis for chemical analyses conducted under the CLP or other well-defined methods. Contract compliance is evaluated only in specific situations. Issues pertaining to contractual compliance are noted where applicable. It is assumed that the data packages is presented in accordance with the CLP (CLP-like or SW-846) requirements. It is also assumed that the data packages represents the best efforts of the laboratory and has already been subjected to adequate and sufficient quality review prior to submission for validation. In instances where SW-846 or other specific methods have been used for the analyses, the validation effort is modified to acknowledge the differences in methodology while maintaining the goals and quality objectives of the CLP.

Results of sample analyses are reported by the laboratory as either qualified or unqualified; various qualifier codes are used by the laboratory to denote specific information regarding the analytical results. During the validation process, laboratory data are verified against all available supporting documentation. Based on this evaluation, qualifier codes may be added, deleted or modified by the data validator. Validated results are either qualified or unqualified; if results are unqualified, this means that the reported values may be used without reservation. Final validated results are annotated with the following codes, as defined in the EPA Region I Functional Guidelines:

U - The material was analyzed for, but was not detected above the level of the associated value. The associated value is either the sample quantitation limit or the sample detection limit

J - The associated numerical value is an estimated quantity.

UJ - The material was analyzed for, but was not detected. The associated value is an estimate and may be inaccurate or imprecise. The sample quantitation limit is an estimated quantity.

R - The data are unusable. (Note: Analyte may or may not be present). Resampling and reanalysis is necessary for verification. The R replaces the numerical value or sample quantitation limit.

These codes (qualifiers) are assigned during the validation process and are based on the data review of the results. They are recorded in the Data Summary Table contained in Attachment A, and the spreadsheet summary files (Attachment B, submitted electronically) of this validation report.

All data users should note two facts. First, **the "R" qualifier means that the laboratory-reported value is completely unusable.** The analysis is invalid due to significant quality control problems, and provides no information as to whether the compound is present or not. Rejected values should not appear on data tables because they have no useful purpose under any circumstances. Second, **no analyte concentration is guaranteed to be accurate even if all associated quality control is acceptable.** While strict quality control conformance provides well-defined confidence in the reported results, any analytical result will always contain some uncertainty as demonstrated in the laboratory control limits.

The user is also cautioned that the validation effort is based on the materials provided by the laboratory. Software manipulation, resulting in misleading raw data printouts, cannot be routinely detected during validation; unless otherwise stated in the report, these kinds of issues are outside the scope of this review.

Detailed Findings of Measurement Error Associated with the Analytical Analysis

I. Preservation and Technical Holding Times (Sample Integrity)

Samples for inorganic analysis (total metals) were collected on September 21-24, 2015, and received by the laboratory the following day with the exception of samples collected on September 22 and 23, which were shipped on September 24 and received on September 25, 2015. All analyses were performed within the established holding times. According to the sample receipt records, the water samples were properly preserved with HNO3 (<2) in the field.

The temperature blanks of the coolers on receipt at the laboratory were checked and documented in the data package to be within or just below the acceptance range of 4 ^{o}C ±2 ^{o}C at 1, 1.5, 4.7 and 1.9^{o}C. Since temperatures were within or slightly below the acceptance range, all sample temperatures were deemed acceptable.

II. Calibration

The samples were analyzed for the ICP elements from 9/29/2015-10/7/2015 on ICPs identified as 16417, 16315, 18255 and ICP MS instruments 11332 and 19024. ICP/MS was used only for the field blank (liquid analyses). Initial and continuing calibration verification (ICV/CCV) standards were run at the required frequencies in all analytical series for all target elements. Results for all ICV/CCV standards were correctly reported on the summary forms, and recoveries of all target analytes were within applicable acceptance limits. For the ICP/MS (6020) data sets all tune criteria and internal standard recoveries met criteria as documented on the Forms 15 and Forms 16 in the data packages. However, the tune Form 15 was missing in the data package PCS27 for the sequence on 10/05/15 on the instrument 19204. Tune data was found in the raw data and was acceptable.

Sample analyses for mercury were performed in analytical series from 9/29/2015-10/2/2015 on the cold vapor instruments identified as 17384 and 19302. Reported correlation coefficients of the initial calibration for mercury analysis are not reported on the data summary forms provided in a Tier II analysis. Results for all ICV/CCV standards bracketing the associated samples were correctly reported on the summary forms, and recoveries of all target analytes were within applicable acceptance limits.

Quantitation limit (QL) check standards as specified in the USEPA Inorganic (ILM) Statement of Work were analyzed at the required frequencies and concentrations for all applicable analytes. Percent recoveries were accurately reported and acceptable (Region I limits:; 70-130 %R, lab limits: 50-150 %R) with the exception of copper (134.7 and 141.7%) in the opening/closing sequence on 10/7/2015. Results for copper in all samples were greater than 2X the reporting limit; therefore, no data was qualified.

III. Blanks

Initial and continuing calibration blanks (ICB/CCBs) were prepared and analyzed at the proper frequency for all target analytes. All laboratory blank results were accurately reported on the Form III

summaries included in the data packages.

No target analytes were detected in the calibration blanks associated with the site samples at concentrations (units = ug/L) above the applicable LOQs or below the negative LOQs. However, responses at concentrations (units=ug/L) greater than the IDL, and values below their respective negative IDLs were observed in one or more of the calibration blanks as follows:

- Arsenic (3.5-4.3), chromium (1.9), selenium (3.7) and copper (3.2-4.4) were detected in the associated calibration blanks above their respective IDLs.

- Lead (-1.8) was detected in associated calibration blanks below its respective IDL.

An appropriate matrix preparation blank was digested with each analytical batch and analyzed with the associated samples. No target analytes were detected in the preparation blanks at concentrations above the applicable LOQs or below the negative LOQs. However, responses at concentrations greater than the MDL and values below the respective negative MDL were observed in the blanks as follows:

- Chromium (0.135 mg/kg) was detected in the soil preparation blank in SDG No. PCS24 and copper (0.473 mg/kg) was detected in the soil preparation blank in SDG No. PCS27 below the detection limit.

- Barium (0.720 ug/L) and cadmium (0.410 µg/L) were detected in the liquid preparation blanks in these SDGs. Since these samples are only related to the liquid field blank sequences, they were not used in evaluating the sediment samples for preparation blank contamination.

All sample results were greater than applicable action limits, with the exceptions of arsenic and selenium; therefore, based on laboratory blank contamination, results for arsenic and selenium reported in all samples below their respective LOQs were qualified as less than the LOQ (U). Field blanks were not qualified based on laboratory blank contamination.

Four field blanks (0160-13FB, 0161-13FB, 0163-13FB, 0165-13FB) were submitted with the site samples in these data packages. No target analytes were detected in the field blanks associated with the site samples at concentrations above the applicable MDLs, with the exceptions of cadmium (0.40 µg/L) in 0160-13FB, barium (0.70-0.92 µg/L) and copper (4.5-9.6 µg/L) in 0161-13FB and 0165-13FB, and mercury (0.056-0.072 µg/L) in 0160-13FB, 0161-13FB, 0163-13FB and 0165-13FB. All sample results (not previously qualified above) were greater than applicable action limits, with the exceptions of mercury and cadmium; therefore, based on field blank contamination, results for cadmium and mercury reported in all samples below their respective LOQs were qualified as less than the LOQ (U). Field blanks were not qualified based on laboratory blank contamination.

IV. ICP Interference Check Sample

Percent recoveries (%R) for the interference check samples were reported on the summary forms. All recoveries were within acceptance limits of 80 to 120 percent.

V. Matrix Spike and Matrix Spike Duplicate Sample Analysis

Samples 0484-13 and 0494-13 were each prepared as a soil matrix spike and matrix spike duplicate (MS/MSD) in association with the samples in this data set. Percent recoveries of all spiked analytes were accurately reported on the Form V summaries included in the data packages. All recoveries were within the laboratory acceptance limits.

VI. Duplicate Sample Analysis

A. Laboratory Duplicate

Samples 0484-13 and 0494-13 were prepared as laboratory duplicate pairs with the samples in this data set. Relative percent difference (RPD) values must be less than 20% for sample values greater than five times the QL, and the control limit of ± QL is used for values less than five times the QL. Paired results for all target analytes were within the applicable acceptance criteria with the exception of barium (21 %RPD) and copper (22 %RPD) in the laboratory duplicate pair from sample 0494-13. Based on poor precision in the laboratory duplicate pair (and annotated as reason code "r" in the spreadsheet deliverables), results for barium and copper in all sediment samples in SDG No. PSC27 were qualified as estimated (J).

B. Field Duplicates

The following samples were identified as field duplicate pairs.

Parent	Duplicate	matrix
0483-13	0163-13DP	sediment
0493-13	0164-13DP	sediment

Paired results for all target analytes in the field duplicate pairs were within the applicable acceptance limits with the exception of chromium (54.9 %RPD) in 0493-13 and 0164-13DP. Based on the poor reproducibility in an associated field duplicate pair, results for chromium in all sediment samples in SDG No. PSC27 were qualified as estimated (J). Relative percent difference (RPD) values must be less than 50% for sample values greater than five times the QL and the control limit of ± 4xQL is used for values less than five times the QL.

VII. Laboratory Control Sample Analyses

Percent recoveries for the water-matrix laboratory control samples (LCS) were accurately reported on the Form VII summaries included in the data packages. Concentrations of all target analytes in the LCS were within the acceptance limits as documented on the Form VII summaries.

VIII. Sensitivity Check

The laboratory reports results to the MDL for samples and to the IDL for calibration blanks. The IDLs reported on Form 10 in the data packages were generated in 7/2015 for the ICP and Hg instruments and in 7/2015 and 8/2015 for the ICP/MS instrument. The MDLs were performed in 7/2015 for ICP metals and mercury analyses, which were within the annual requirements established by CLP and SW846 methods. ICP interelement correction factors and the ICP linear ranges were established in 11/2014, 7/2015 and 8/2015. The laboratory reports detections to the MDL and non-detects to the laboratory LOQ.

IX. PE Samples/Accuracy Check

An external matrix single blind PES sample was not submitted or required with the samples in this data set.

X. Furnace Atomic Absorption QC

None of the samples in this data set was analyzed pursuant to furnace atomic absorption spectroscopy.

XI. ICP Serial Dilution Analysis

ICP serial dilutions were performed on the same samples as the batch MS/MSD analyses. Percent difference (%D) values were less than the maximum acceptance limit of 15% for all target analytes in which the original concentration (in the undiluted sample) was greater than 50 times the IDL with the exception of copper (17%D). Based on the matrix interferences observed in the serial dilution, results for copper in all sediment samples in SDG No. PCS27 were qualified as estimated (J).

XII. Sample Result Verification

Sample result verification using the raw data printouts is not evaluated in a Tier II validation assessment. As specified in the SDG Narrative, the IDLs are used for determining the U flags on the initial and continuing calibration blanks. The highest IDL is selected when multiple instruments are used for an analysis. The MDLs are used for determining all other U flags. The laboratory reported all results to the LOQ on the analysis reports; however, target compounds detected in the associated samples below the LOQ but greater than the MDL (as reported on the Form 10) were reported on the Form Is with a “J” (estimated) qualifier. The “J” qualifiers were not removed by the validator, unless previously qualified based on laboratory blank contamination. Analysis Form 1s included in the data reports in the metals section used "B" qualifiers for values less than the LOQs which should be replaced with a “J” value if presented. These Form 1s were disregarded in the validation effort since they also reported results with a non-detect to the MDL.

Samples 0499-13 (28.0 %Solids) and 0497-13 (29.3 %Solids) exhibited % solids of less than 30% but greater than 20%. In keeping with previous project work and the approved QAPP, no qualifications were applied on the basis of the percent solids less than 30% but greater than 10%.

The values that the validator has judged to be acceptable are presented in the "Validator_Result" columns (see below for further details) in the Data Summary Table in Attachment A and in the spreadsheet summary file submitted electronically as Attachment B. The final qualifiers based on the validation effort are presented in the "Validator_Qualifier" column in the Data Summary Table and in the spreadsheet summary file. All results, positive and non-detect, are listed in the these summaries, whether or not the value or qualifier was changed as a result of the validation; if a value or qualifier was changed, this is indicated by the "Y" (for yes) notation in the column "Validator_Change" in the Data Summary Table. A brief explanation of the reason for the validation change is coded in the "Validator_Reason" column in the Data Summary Table and the full spreadsheet summary file; the definitions of these codes are given at the end of the Data Summary Table and on a separate tab of the spreadsheet file. Sample-specific (practical) quantitation limits (PQL) are given in the summaries.

All results are reported on a dry weight basis in the analytical report section and on the EDD. It should also be noted that for sediments, percent moisture was measured after decanting; the raw data for these weights may be found in the decanting bench sheets.

XIII. Overall Evaluation of Data

Based on the validation effort, results for the inorganic analytes in all samples were determined to be valid as reported with the following exception and observation:

- Based on laboratory blank contamination, results for arsenic and selenium reported in all samples below their respective LOQs were qualified as less than the LOQ (U). Field blanks were not qualified based on laboratory blank contamination.

- Based on field blank contamination, results for cadmium and mercury reported in all samples below the respective LOQ were qualified as less than the LOQ (U). Field blanks were not qualified based on laboratory blank contamination.

- Based on poor precision in the laboratory duplicate pairs, results for barium and copper in all sediment samples in SDG No. PCS27 were qualified as estimated (J).

- Based on the poor reproducibility in an associated field duplicate pair, results for chromium in all sediment samples in SDG No. PSC27 were qualified as estimated (J).

- Based on the matrix interferences observed in the serial dilution, results for copper in all sediment samples in SDG No. PCS27 were qualified as estimated (J).

- The laboratory reported all results to the LOQ or RL on the analysis reports in the analysis results section of the data package; however, target compounds detected in the associated samples below the LOQ but greater than the MDL (as reported on the Form 10) were reported on the Form Is with a "J" (estimated) qualifier. The "J" qualifiers were not removed by the validator, unless previously qualified based on laboratory or field blank contamination. Analysis Form 1s included in the metals section of the data packages used "B" qualifiers for

values less than the LOQs. These Form 1s were disregarded in the validation effort since the laboratory also reported results with a non-detect to the MDL. As stated in the case narrative, the IDLs are used for determining the U flags (non-detects) on the initial and continuing calibration blanks. The highest IDL is selected when multiple instruments are used for an analysis. The MDLs are used for determining all other U flags.

XIV. Documentation

Chain-of-custody (COC) and internal chain of custody (ICOC) records were present and completed accurately. Data presentation was acceptable, with the following exception:

- The Form 15 (Tune) was missing from SDG No. PCS27, the tune data was found in the raw data and was acceptable. The missing document has been requested from the laboratory, and if received should be maintained with this report in Appendix C.

This validation report should be considered part of the data packages for all future distributions of the inorganic (total metals) data.

December 16, 2015

EXECUTIVE SUMMARY

Phoenix Chemistry Services (Phoenix) has completed the validation of the Total Organic Carbon (TOC) analysis data by prepared by Eurofins Spectrum Analytical of Agawam, MA, as a sub-contractor to Eurofins Lancaster Laboratories for 12 soil and sediment samples and 2 field duplicates (FDs) from the Pine Street Canal Site in Burlington, VT. The laboratory reported the data under Sample Delivery Group (SDG*)* Nos. PSC24 and PSC27, which were submitted as two data packages received by Phoenix on November 23, 2015, with revisions received on December 8 and December 16, 2015, and which include the following samples:

Sample Location Identifier (SLID)	Sample Identifier Number (SIN)	Spectrum Laboratory ID	Lancaster Laboratory ID

A cross-reference of sample IDs was provided in the data packages from each laboratory.

The validation effort found all sample results acceptable as reported, following receipt of full revisions, which were required because the original data packages included adjustment for percent moisture in the samples; however, the sub-contracting laboratory performs the Lloyd Kahn TOC analysis on oven-dry samples, so the results were already reported on a dry-weight basis.

The Overall Evaluation of Data (Section IX) summarizes the validation results. The validation findings and conclusions for each analytical parameter are detailed in the remaining sections of this report. The validation effort determined that the results as presented in the fully revised data packages are acceptable as presented.

Documentation deficiencies observed in the data packages are described in Section X.

This validation report shall be considered part of the data package for all future distributions of the Total Organic Carbon (TOC) analysis data.

INTRODUCTION

Analyses were performed according to the USEPA Region II "Lloyd Kahn" Method for total organic carbon (TOC), and as described in Spectrum Analytical SOP for Total Organic and Inorganic Carbon by Lloyd Kahn Method (Revision No. 5, 06/15/15).

Phoenix Chemistry Services' validation was performed to the extent possible in conformance with Tier II guidelines as defined by USEPA Region I. Data qualifiers are applied as necessary and appropriate. The data were evaluated in accordance with the "Region I EPA-NE Data Validation Functional Guidelines for Evaluating Inorganic Analyses" (2/89 modifications). The Quality Assurance Project Plan (QAPP; The Johnson Company, Revision 5, December, 2006) and EPA's National Functional Guidelines for Inorganic Data Review (EPA 540-R-04-004, October 2004) were also considered during the evaluation, and professional judgment was applied as necessary and appropriate.

The data validation process evaluates data on a technical basis for chemical analyses conducted under the CLP or other well-defined methods. Contract compliance is evaluated only in specific situations. Issues pertaining to contractual compliance are noted where applicable. It is assumed that the data package is presented in accordance with the CLP (CLP-like or SW-846) requirements. It is also assumed that the data package represents the best efforts of the laboratory and has already been subjected to adequate and sufficient quality review prior to submission for validation. In instances where SW-846 or other specific methods have been used for the analyses, the validation effort is modified to acknowledge the differences in methodology while maintaining the goals and quality objectives of the CLP.

Results of sample analyses are reported by the laboratory as either qualified or unqualified; various qualifier codes are used by the laboratory to denote specific information regarding the analytical results. During the validation process, laboratory data are verified against all available supporting documentation. Based on this evaluation, qualifier codes may be added, deleted or modified by the data validator. Validated results are either qualified or unqualified; if results are unqualified, this means that the reported values may be used without reservation. Final validated results are annotated with the following codes, as defined in the EPA Region I Functional Guidelines:

U - The material was analyzed for, but was not detected above the level of the associated value. The associated value is either the sample quantitation limit or the sample detection limit

J - The associated numerical value is an estimated quantity.

UJ - The material was analyzed for, but was not detected. The associated value is an estimate and may be inaccurate or imprecise. The sample quantitation limit is an estimated quantity.

R - The data are unusable. (Note: Analyte may or may not be present). Resampling and reanalysis is necessary for verification. The R replaces the numerical value or sample quantitation limit.

These codes (qualifiers) are assigned during the validation process and are based on the data review of the results. They are recorded in the Data Summary Table contained in Attachment A and the spreadsheet summary files in Attachment B (submitted electronically) of this validation report.

All data users should note two facts. First, **the "R" qualifier means that the laboratory-reported value is completely unusable.** The analysis is invalid due to significant quality control problems, and provides no information as to whether the compound is present or not. Rejected values should not appear on data tables because they have no useful purpose under any circumstances. Second, **no analyte concentration is guaranteed to be accurate even if all associated quality control is acceptable.** While strict quality control conformance provides well-defined confidence in the reported results, any analytical result will always contain some error.

The user is also cautioned that the validation effort is based on the materials provided by the laboratory. Software manipulation, resulting in misleading raw data printouts, cannot be routinely detected during validation; unless otherwise stated in the report, these kinds of issues are outside the scope of this review.

Detailed Findings of Measurement Error Associated with the Analytical Analysis

I. Preservation and Technical Holding Times (Sample Integrity)

Samples for TOC analysis in SDG. Nos. PSC24 and PSC27 were collected on September 21-24, 2015, and were received by the Lancaster laboratory on Sep. 22 and 25, 2015, and by Spectrum on Oct. 2, 2015. All sample analyses were performed within the established holding time of 14 days for analysis of samples maintained at 4°C.

The temperature blanks of the coolers on receipt at the laboratory were checked and documented in the data packages to be within or just below the acceptable range of <6°C °C at 1.0, 1.5, 4.7, and 1.9 °C on arrival at Lancaster, and at 0.7, -0.1, and -0.3 °C on arrival at Spectrum. Since temperatures were within or slightly below the acceptance range, and the laboratory did not note the presence of ice in any sample, all sample temperatures were deemed acceptable.

II. Calibration and Analytical Sequence

One "high-range" IC (7/23/15) and one "low-range" IC (7/24/15) were performed on the instrument identified as TOC2 (Teledyne Tekmar Apollo 9000) in support of the sample analyses in this data set. The high-range IC consists of seven concentration levels: 0, 1000, 2000, 4000, 8000, 12,500, and 15,000 micrograms (ug) C, and the low-range IC consists of seven concentration levels: 0, 125, 250, 500, 1000, 2000, 4000, and 8000 ug C. The ICs are documented with a graphical presentation of the data points giving the calibration coefficient and the linear regression formula, and with a summary form of the response factors. However, the preparation bench sheet and the raw data from the low-range initial calibration were not originally included in either data package, and were requested by the validator. A revision from Spectrum was received on December 8, 2015, including the missing calibration data. This file, which is included in Attachment C of this report, should be incorporated into the TOC section of the data packages for both PSC24 and PSC27, and maintained with them. The calibration coefficient value (0.999) for each IC was acceptable. The independent calibration verification (ICV) analyses, as required by the method, and the initial calibration blank (ICB) were submitted with the ICs, and were acceptable (108 percent recovery [%R] for the high-range ICV and 111 %R for the low-range ICV, and non-detect for the ICBs).

Sample analyses for TOC were performed in two analytical series on 10/3/15. The first sequence began with analysis of what appear to be a high and a low standard that were not formally reported. Otherwise, each analytical sequence began with a continuing calibration verification (CCV) followed by a continuing calibration blank (CCB) analysis, followed by a preparation blank, a laboratory control sample (LCS) for that preparation batch, and then analysis of a standard reference material (SRM). The sample analyses then began, and after five samples were followed by a CCV and CCB analyses. These were followed by another sequence of not more than ten sample analyses before analysis of another CCV and CCB, and the analytical sequence ended with another CCV and CCB. Required replicate analyses were analyzed within the sample sequences.

The calculated recovery results for the LCS, CCV, and CCB analyses were shown for all analyses on summary forms and on the instrument run log within the raw data section, and were all within the applicable

acceptance criteria of ±15% of the expected value for the spiked analyses, and were non-detect for all blank analyses.

III. Blanks

Results from two preparation blanks were reported as method blanks (MBs) for the two preparation batches, although a method blank (MB) is not required by the Lloyd Kahn method. Results for one ICB and six CCB analyses were reported. No contamination was detected in any reported blank results. The results of the MBs were reported on the Summary Section forms as not detected at 100 mg/Kg C, with a method detection limit (MDL) at 99 mg/Kg C.

IV. Matrix Spike Sample Analysis

A matrix spike (MS) analysis was not requested or performed for the TOC sample analyses reported in this data set.

V. Duplicate Sample Analysis

A. Laboratory Duplicate

Samples 0489-13 and 0495-13 were each prepared as a set of soil laboratory duplicates for the samples in this data set and the relative percent difference (RPD) results were reported. Paired results for TOC in the laboratory duplicate pairs were within (11 and 5.5 %RPD, respectively) the laboratory established acceptance limit (15 %RPD) for each pair of duplicate samples.

A quadruplicate sample analysis was performed and reported on a non-site sample in SDG No. PSC24, and quadruplicate analysis of site sample 0495-13 was performed and reported with SDG No. PSC27. Both sets of laboratory quadruplicate analyses were within applicable specifications, at 9.9 and 12.3 %RSD, respectively, for the quadruplicate analyses.

B. Field Duplicates

Sample 0163-13DP was identified as a field duplicate of 0483-13, and sample 0164-13DP was identified as a field duplicate of 0493-13. Precision was acceptable (<50 %RPD) for paired results in the field duplicate pair 0483-13 and 0163-13DP, at 17.6 % RPD, and at 5.5 %RPD for the field duplicate pair 0493-13 and 0164-13DP.

VI. Laboratory Control Sample Analyses

Percent recoveries (at 88-118 %R) for the four associated laboratory control samples (LCSs) were accurately reported on the Quality Control Summary forms within the Sample Summary sections, and were within the laboratory acceptance limits of 75 – 125% R.

VII. PE Samples/Accuracy Check

An external solid-matrix single blind PES sample was not submitted or required with the samples in this data set.

VIII. Sample Result Verification

All field sample results appeared to be accurately reported on the Analytical Report summary forms included in the data package; however, results were significantly higher than previous sampling rounds, and the project Quality Assurance Officer and the independent data validator both questioned the accuracy of these results. The laboratory was asked to investigate twice, and following internal review, determined that the sub-contracting laboratory (Eurofins Spectrum) performs Lloyd Kahn analysis on oven-dried samples, including pre-analysis weight determination. Therefore, the percent moisture correction performed by the contracting laboratory (Eurofins Lancaster) incorrectly raised the results by this factor. The results were corrected by Eurofins Lancaster and reported in revisions received on December 16, 2015.

Two samples were submitted with a high moisture content; sample 0497-13 exhibited a 70.7% moisture (29.3 % solids) and sample 0499-13 exhibited a 72.0% moisture (28.0 % solids) content. Two laboratory control samples were used for laboratory duplicate analysis, and acceptable precision was exhibited in these analyses (at 100 % moisture in all LCS analyses). Since all site samples were analyzed after drying, and suitable sample volumes were utilized for TOC, no qualifications were deemed necessary on the basis of the unacceptably low solids content.

The values that the validator has judged to be acceptable are presented in the "Result" column in the Data Summary Table in Attachment A and in the "Validator_Result" column in the spreadsheet summary file submitted electronically as Attachment B. The final qualifiers based on the validation effort are presented in the "Validator_Qualifier" column in the Data Summary Table and in the spreadsheet summary file. All results, positive and non-detect, are listed in the these summaries, whether or not the value or qualifier was changed as a result of the validation; if a value or qualifier was changed, this is indicated by the "Y" (for yes) notation in the column "Validator_Change" in the Data Summary Table. A brief explanation of the reason for the validation change is coded in the "Validator_Reason" column in the Data Summary Table and the full spreadsheet summary file; the definitions of these codes are given at the end of the Data Summary Table and on a separate tab of the spreadsheet file. Sample-specific (practical) quantitation limits (PQL) are given in the summaries.

IX. Overall Evaluation of Data

Based on the validation effort, results for the analyte TOC in all samples were determined to be valid as reported in the final revisions.

- Since analytical weight determination was performed by Eurofins Spectrum prior to the Lloyd Kahn analysis for TOC, the percent moisture correction performed by Eurofins Lancaster incorrectly raised the results by this factor. Correct results were submitted in the revisions received on December 16, 2015.

Documentation problems observed in the data packages are described in Section X.

X. Documentation

The chain of custody (COC) records were present and accurately completed for all reported samples in this TOC data set. Data presentation was acceptable, with the following exceptions:.

- Raw data for the initial calibration curve performed on instrument TOC2 on 7/24/15 was not included in either data package. The validator requested submittal of all relevant initial calibration raw data, and this was provided on December 8, 2015. The revision is included in Attachment C of this report, and should be maintained with both PSC24 and PSC27.

- Sample identifiers used within the raw data in SDG No. PSC27 were not identical to the laboratory identifiers used for reporting. The validator requested that the laboratory verify that the correct samples had been analyzed and reported. They reported that the analyst has mis-typed the identifiers, and that the software did not allow corrections, but that the correct samples had been analyzed.

- A revision consisting of the Analysis Reports from Eurofins Lancaster and the full report from Eurofins Spectrum was submitted for each data package on December 16, 2015. Because of the size of these data packages, they have not been attached to this report, but they should replace the Analysis Reports and the TOC sections of the original data packages, and be maintained with them. The raw data and summary forms associated with the IC on 7/24/15 are included in these packages.

This validation report should be considered part of the data packages for all future distributions of the Total Organic Carbon (TOC) analysis data.

Subject: RE: 1596019- Client Questioning Spectrum report
From: Alejandro Paredes Morales <AlejandroParedes@eurofinsUS.com>
Date: 12/8/2015 9:56 AM
To: Barbara Weyandt <BarbaraWeyandt@eurofinsUS.com>, Rebecca Merz <RebeccaMerz@eurofinsUS.com>, Alejandro Paredes Morales <AlejandroParedes@eurofinsUS.com>, Wendy Kozma <WendyKozma@eurofinsUS.com>
CC: Kevin Moran <KevinMoran@eurofinsUS.com>, Alejandro Paredes Morales <AlejandroParedes@eurofinsUS.com>

Hi Barbara!

From the raw data which is present in SDG #PSC27, it appears that two different initial calibrations were used. One is referred to as "HIGH 072315". The second of these appears to be what is presented in graphical form on page 1351 of Lancaster's data package, or page 58 of Spectrum's data package. The other is written (typed) in as "072415low", and the printed reference to "063015 low" has been crossed out. If the 072415low is different than the HIGH 072315, please submit all relevant pages for the missing calibration, including the Detailed Analysis Report and the graphical presentation, with the linearity coefficient calculated.

We will issue a revised data package for SC13115.

Within the raw data pages, starting on page 1358 (Spectrum's page 65) and possibly continuing onto the following page, the laboratory identifier for the client samples is incorrect (SC12115-xx instead of SC13115-xx). Please verify that these are indeed the correct analyses for the samples submitted.
This was a typo when loaded in the instrument, samples submitted where ran. Instrument doesn't allow to change them once have been run

Additionally, our data validator is also trying to understand how these results may be compared to previous results, and has a request for additional items from the Spectrum laboratory. Please submit the raw data for the Lloyd Kahn analysis for the initial calibration curve analyzed on instrument TOC2 on July 23 2015 at 11:19 (Calibration ID 1507063). The data packages PSC24 and PSC27 contain the graphical presentation of this calibration, but the original raw data (the "Detailed Analysis Report" instrument printout) is not present in the data packages. Please also include an example calculation demonstrating the use of this calibration for any one of the samples in these two sample sets (SC13114-01 through SC13114-04 or SC13115-01 through SC13115-07). Please don/t hesitate to contact me with questions or comments, or if you need more information. Thank you again for your assistance.

Hopefully you relayed the message that we were looking into this issue to Jim last Thursday so he at least knows someone is

taking his questions to the right personnel.

We apologize for the delay we had staff out on Friday that were responsible for putting the data package together and needed clarification from this analyst since the datafile was in question with their handwritten notes.

There is nothing wrong with the data we are working to put together a response that clearly explains the calibrations and data.

We will have this to you as early tomorrow as possible.

Thank you,
Rebecca

Subject: FW: 1596019- Client Questioning Spectrum report

Rebecca,

Our client is questioning some TOC results that Spectrum Labs reported to us. See attached Spectrum report.

Will you please read through the clients concerns and provide the requested documentation?

Please reply to all with your response.

Thank you,
Wendy

Could you please add the following requests to your investigation?

In the data package for SDG #PSC27, Spectrum SDG #SC13115, there are a number of inconsistencies or possible errors within the sub-contracted data package.

First, no copy of the raw data for any initial calibration is presented (the "Detailed Analysis Report", showing the actual instrument output) for any of the reports. As noted below, I will need this to complete the validation.

From the raw data which is present in SDG #PSC27, it appears that two different initial calibrations were used. One is referred to as "HIGH 072315". The second of these appears to be what is presented in graphical form on page 1351 of Lancaster's data package, or page 58 of Spectrum's data package. The other is written (typed) in as "072415low", and the printed reference to "063015 low" has been crossed out. If the 072415low is different than the HIGH 072315, please submit all relevant pages for the missing calibration, including the Detailed Analysis Report and the graphical presentation, with the linearity coefficient calculated.

Within the raw data pages, starting on page 1358 (Spectrum's page 65) and possibly continuing onto the following page, the laboratory identifier for the client samples is incorrect (SC12115-xx instead of SC13115-xx). Please verify that these are indeed the correct analyses for the samples submitted.

Subject: TOC Results

Hi Barb,
It was brought to my attention that the TOC results listed on the benthic sample report (Benthic Samples #1596019) are Orders-of-Magnitude higher than what we have previously collected at the site. The levels reported are indicative of free phase coal tar, and in speaking with the field crew, there were no visual or olfactoral observations of product by the sample team. Is confirmation that Spectrum may have already converted the TOC results to dry weight prior to releasing the data to Lancaster available? I appreciate any information you could provide regarding Spectrum's report.

Additionally, our data validator is also trying to understand how these results may be compared to previous results, and has a request for additional items from the Spectrum laboratory. Please submit the raw data for the Lloyd Kahn analysis for the initial calibration curve analyzed on instrument TOC2 on July 23 2015 at 11:19 (Calibration ID 1507063). The data packages PSC24 and PSC27 contain the graphical presentation of this calibration, but the original raw data (the "Detailed Analysis Report" instrument printout) is not present in the data packages. Please also include an example calculation demonstrating the use of this calibration for any one of the samples in these two sample sets (SC13114-01 through SC13114-04 or SC13115-01 through SC13115-07). Please don/t hesitate to contact me with questions or comments, or if you need more information. Thank you again for your assistance.

MEMORANDUM

Date: **December 28, 2015**

From: **James R. Bowes, P.G.** JRB
Pine Street Canal Superfund Site
Quality Assurance Officer

To: **QA/QC File**

CC: **Guy Vaillancourt, Project Manager**

Re: **Procedure Deviation Alerts:**

AWR-METHOD #007-020
JEP METHOD #007-2015-1
JRB-METHOD #008-001
RJP-METHOD #007-2015-1
RJP-METHOD #2007-2015-2

Job#: **1-0870-02**

I have reviewed the above referenced Procedure Deviation Alerts (PDA) related to fall 2015 compliance monitoring. A description of the non-conforming situations and corrective actions taken are provided in the attached completed PDA forms. The appropriate corrective actions were completed , and there are no adverse effects to the integrity and usability of the data set.

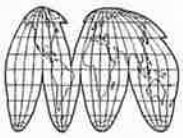
PROCEDURE - DEVIATION

ALERT



Alert No: AWR-METHOD#007-020
To: Jim Bowes, The Johnson Company - Quality Assurance Officer
From: Adam Robtoy
Date: December 17, 2015
Re: **SIN Discrepancy COC – 384521, SIN: 0162-13DP**

BACKGROUND: During the 2015 annual subaqueous sand cap monitoring event, the duplicate sample collected on September 21, 2015 (SLID: J_0162-13DP, SIN: 0162-13DP) was incorrectly documented on the chain of custody as SIN: 0163-13DP. The laboratory logged the sample in and reported the results with the incorrect SIN (0163-13DP).

ACTION: This alert was prepared to document the deviation, and the SIN was corrected in the analytical database.

PROCEDURE - DEVIATION

A L E R T !

Alert No: JEP- Method #007 – 2015-1
To: Pine Street Canal Site QA File
CC: Guy Vaillancourt - Project Manager
From: Johanna Palmer, Staff Scientist
Date: 11/11/15
Re: Chain of Custody # 376957 Transcription Error: Incorrect Sample Identification Number and Sample Location Identification Number

BACKGROUND: Chain of Custody # 376957 was submitted with an incorrect Sample Location Identification Number (SLID) and Sample Identification Number (SIN), for the field duplicate sample J_0085-33DP. The correct SIN for this sample is 0085-33DP. Chain of Custody (COC) 376957 was submitted with the incorrect SLID of J_0085-33 and incorrect SIN of 0085-33, and the analytical lab logged the sample in under the SIN that was incorrectly entered on the COC (laboratory sample number 8082101). The sample jars were correctly labeled as SLID J_0085-33DP and SIN 0085-33DP.

ACTION: Alert was prepared for the Project Manager by the Staff Scientist. A copy of this PDA will also be included with the Fall 2015 Compliance Monitoring Report, and also with the original laboratory data package. The correct SIN will be transcribed onto the original laboratory report, and the correct SLID and SIN will be entered into the project database for this sample so that the sample results for the 2015 cap coring and benthic monitoring event appear at the correct SLID location.

Re: Transcription Error: Incorrect Sample Intake Depth for monitoring well J_MW-22A

BACKGROUND: An incorrect sample intake depth of 15.2 feet below top of casing for monitoring well J_MW-22A was listed on the Groundwater Sample Collection form dated May 6, 2015. This incorrect depth was discovered during update of the database with the fall 2015 groundwater purge parameters. The correct sample intake depth for MW-22A is 21.6 feet which correctly places the intake in the approximate center of the five-foot screened interval. The incorrect depth of 15.2 feet was entered on the Groundwater Sample Collection form due to transcription error.

ACTION: This Alert has been prepared by the QA Officer for the QA File and Project Manager. The correct intake depth will be entered into the project database. A copy of this PDA will also be included with the Compliance Monitoring Report for the Fall 2015 groundwater sampling.

Date: 09/30/15
Re: Chain of Custody # 384523 Transcription Error: Incorrect Sample Identification Number

BACKGROUND: Chain of Custody # 384523 and sample labels were submitted with an incorrect Sample Identification Number (SIN) for the benthic sample J_T21+00-E50 collected on 9/22/15 at 10:45. The correct SIN for this location is 0499-13. Chain of Custody (COC) 384523 was submitted with the incorrect SIN of 0498-13, and the analytical lab logged the sample in under the SIN that was incorrectly entered on the COC (laboratory sample numbers 8064406 and 8064407).

ACTION: The laboratory was initially notified of the error and correct SIN was provided by email after receipt of the log-in report. Alert was prepared for the Project Manager by the Staff Scientist and copied to the analytical laboratory. A copy of this PDA will also be included with the Fall 2015 Compliance Monitoring Report, and also with the original laboratory data package. The correct SIN will be transcribed onto the original laboratory report, and will be entered into the project database for this sample so that the sample results for the 2015 cap coring and benthic monitoring event appear at the correct SLID location.

Alert No: RJP- Method #007 – 2015-2
To: Pine Street Canal Site QA File
CC: Guy Vaillancourt - Project Manager
From: Ross Predom, Staff Scientist
Date: 11/11/15
Re: Chain of Custody # 384726 Transcription Error: Incorrect Sample Identification Numbers

BACKGROUND: Chain of Custody # 384726 was submitted with two incorrect Sample Identification Numbers (SIN), for the following samples: J_SW-DP collected on 9/22/15 at 14:20; and J_SW-FB collected on 9/22/15 at 14:45. The correct SIN for J_SW-DP is 0122-24DP. The correct SIN for J_SW-FB is 0123-24FB. These samples and the Chain of Custody (COC) 384726 were submitted with the incorrect SIN of 0122-24 for J_SW-DP, and 0123-24 for J_SW-FB, and the analytical lab logged the sample in under the SINs that were incorrectly entered on the COC (laboratory sample numbers 8064321 and 8064322).

ACTION: Alert was prepared for the Project Manager by the Staff Scientist. A copy of this PDA will also be included with the Fall 2015 Compliance Monitoring Report, and also with the original laboratory data package. The correct SINs will be transcribed onto the original laboratory report, and will be entered into the project database for this sample so that the sample results for the 2015 cap coring and benthic monitoring event appear at the correct SLID location.

1.0 INTRODUCTION

Monitoring events for the 2015 on-site compensatory restoration were conducted on June 10 and September 24, 2015; and for the off-site compensatory restoration area at the Ethan Allen Homestead on June 11, 2015. These monitoring events are specified in the Restoration Plan ("Plan") for Mitigation of Habitat Loss Due to Installation of the Amended Cap, The Johnson Company, July 26, 2012. The Plan calls for two monitoring events for the restoration area at the Pine Street Canal site ("Site") and one monitoring event for the off-site restoration area at the Ethan Allen Homestead (EAH).

2.0 ON-SITE COMPENSATORY RESTORATION MONITORING

2.1 SPRING MONITORING

The spring 2015 monitoring of the on-site restoration areas at the Pine Street Canal Site was conducted on June 10, 2015 by The Johnson Company. The monitoring quadrats established in the north restoration area (North Area Plot) and south restoration area (South Area Plot) have been marked by GPS so that they can be put on site plans and re-visited for future monitoring (Figure 1). The North Area Plot is approximately 25 feet by 50 feet and the South Area Plot is approximately 50 feet by 50 feet.

Overall, the restoration areas survived the winter very well. Photos are presented in Attachment A. Out of over 400 plantings, no mortalities were noted. The spring lake level did not exceed 98 feet (1988 NGVD) so the edge of the Canal, the North and South Paths and the western edges of the North and South Areas were not flooded. Heavy rain had occurred during the two days preceding the monitoring event which was the source of the ponded water observed in the North and South Path and South Area (see Photos A-2 and A-17). Both the North Area (Photos A-8 and A-9) and South Areas (Photos A-11 and A-12) were well vegetated. The area between the canal access road and the Canal was well vegetated (see Photos A-5 and A-6). The volunteer cottonwood in the North Plot noted in fall 2014 was still present (Photo A-10). A large patch of Canadian anemones (*Anemone canadensis*) was in bloom at the east end of the North Path (Photo A-13). No mortalities were observed in the monitoring plots or outside of these

areas. Monitoring data are presented in Table 1.

2.2 FALL MONITORING

The fall 2015 monitoring event was conducted on September 24, 2015 by The Johnson Company. The photos from this monitoring event are presented in Attachment B. The trimming around the trees had been done July 21st and the first week in September. All of the plantings had survived the summer. Four enclosures around the trees had been damaged, and these were replaced by Treeworks on September 28th. A large dead tree had fallen across the South Path. (Photos B-9 and B-10) The main trunk fell between the plantings, but branches brought down by the falling tree damaged two of the highbush cranberries. (See Photo B-11). Treeworks had cleared the brush from around the plantings. The small cottonwood that had volunteered in the North Area Plot in 2014 is still present. Silver maple (*Acer saccharinum*) and high bush cranberry (*Viburnum opulus americanum*) showed moderate insect damage, but this damage did not appear to threaten survival. Boxelder (*Acer negundo*) and the dogwoods (*Cornus amomum and C. sericea*) seemed unaffected by insects. Light deer browse was also observed on many trees, especially the silver maple. (Photo B-15) A three well cluster installed by Stone Environmental in the North Area has not interfered with any of the restoration plantings. (Photo B-16) Many of the green ash trees had dropped their leaves, but all had healthy buds. Dry summer conditions contributed to the early senescence of the green ash. The planted sensitive ferns (*Onoclea sensibilis)* had turned brown and presented fertile fronds with beadlike spore cases, as is expected in late September. Volunteer dogwoods continue to colonize the area to the east of the Canal access road between the planted shrubs. A volunteer green ash was also noted in this area (See Photo B-5). Another volunteer green ash was noted in the South Area outside of the monitoring plot. The monitoring data are presented in Table 1.

Ground cover was well established in the North and South Areas, and along the Canal, estimated at 100% for these areas. The dominant species in the North and South Areas were clovers (*Trifolium pretense, T. repens, Melitotus officinalis*). Since the grass had been cut, grass identification was not attempted. The ground cover in the South Path was also 100 %. The

ground cover on the North Path was 95%. The ground cover in the paths had little clover, and showed more grasses and wildflowers. Examples include: showy tickseed (*Bidens cernua*); ditch stonecrop (*Penthorum sedoides*); bugleweed (*Lycopus uniflorus*); wild strawberry (*Fragaria virginiana*); wild lettuce (*Lactuca canadensis*); deer tongue (*Panicum clandestinum*); and rough barnyard grass (*Crus-galli muricata*). The vegetation between the Canal access road and the Canal had been mowed, but is well established, estimated at 100% coverage (see Photo B-6).

2.3 INVASIVE SPECIES CONTROL

The restoration areas had been treated with herbicide for *Phragmites* control in August, 2013, prior to the restoration planting, and small areas of Japanese knotweed (*Polygonum cuspidatum*) at the edges of the North and South Areas had been treated in September 2013 (see Figure 1). Herbicide treatment was repeated on the restoration areas and the small areas of knotweed outside the areas in 2014. In 2015, some Japanese knotweed had survived at the edges of the restoration area (Photos A-16 and A-17) and a single Japanese knotweed plant appeared in the South Plot (Photo A-11). Also, some *Phragmites* was present on the west side of the North Area (Photo A-16), the west side of the South Area (Photo A-17) and at the South Slip (Photo A-6).

Therefore, invasive species control was conducted during August 2015 for *Phragmites* and Japanese knotweed. Some *Phragmites* and Japanese knotweed survived the August treatment (Photo B-19), so a follow-up spot treatment was conducted on September 28, 2015.

The initial introduction of the *Galerucella spp.* beetles continues to control the purple loosestrife at the Pine Street Canal site. Evidence of herbivory can be seen in Photo A-14.

3.0 OFF-SITE COMPENSATORY RESTORATION MONITORING

The monitoring of the off-site restoration area at the Ethan Allen Homestead was conducted on June 11, 2015. As reported in the 2013 Monitoring report 115 trees were planted in April 22, 2013. The Winooski River flooded several times during the spring and summer of

2013. Severe flooding also occurred in the spring of 2014. These flood events have affected the restoration area and the loss of trees was reported in the 2014 monitoring report. Flooding did not occur in spring 2015, and trees were not observed on the riverbank or in the water. Fifty trees survived, although some were not in good condition. Forty-seven trees were dead and 18 trees were missing and presumed dead. The survival rate was 48%. Some of the trees have done very well and are 6-10 feet tall and visible above the surrounding vegetation (See Photos C-1 through C-4). Trees rated fair or poor generally did not have live vegetation visible above the surrounding vegetation and often were re-sprouting from the bottom. Site inspection photos are in Attachment C and the monitoring data are presented in Table 2.

4.0 CONCLUSION

The installation of the Amended Cap resulted in temporary construction impacts to approximately one and one-third acres of the site. However, in order to monitor and maintain the Amended Cap a gravel access road was installed to allow access to the monitoring and recovery wells, and the area between the road and the canal was to be maintained free of woody vegetation that could impair visual observation of the canal. Thus this area could not be returned to a wooded riparian area. To compensate for this loss of approximately 0.4 acres of wooded riparian area, the construction areas on-site were planted with trees and shrubs, and further compensation was provided by an off-site mitigation project consisting of planting trees in a riparian buffer area at the Ethan Allen Homestead with trees. The Vermont NRCS Specification Guide Sheet-Riparian Forest (391) was used to determine the number of trees and shrubs to plant. This guidance recommends planting 300-400 stems per acre in order to achieve a density of 150 stems per acre in the mature forest buffer.

The on-site restoration consisted of planting 375 trees and shrubs and seeding the planting areas with appropriate restoration seed mixes. There have been no losses of trees or shrubs in the planted areas and, as noted in the monitoring results, some native trees and shrubs are colonizing the planted areas. The area between the access road and the canal is fully vegetated with a mix wetland plants. Therefore the restoration planting has exceeded

expectations. Herbicide treatments for invasive species and removal of buckthorn have been undertaken for three years. The Plan called for an evaluation of the invasive species control after three years. Based on the success of the restoration, no further herbicide treatment or cutting of buckthorn is recommended, and continued monitoring of the restoration plantings is no longer necessary.

The goal of the off-site buffer plantings at the Ethan Allen Homestead was to create the equivalent of one-quarter acre of wooded riparian buffer by planting a one-eighth of an acre with area within a 2-acre buffer with 57 trees and planting 48 trees in the remaining portion of the 2-acre buffer (Figure 2). Based on the 150 woody stems per acre, the final tree density in the 1/8-acre are is 19 trees, and the total stems equivalent to ¼-acre is 38 trees. Thus despite the mortality at Ethan Allen Homestead, the 50 surviving trees are more than needed to create the desired tree density and achieve the objective in the Plan. Accordingly, no further action is necessary.

Results 2014

115 Trees planted in 2013
30 dead on 6/6/14
4 missing on 6/6/14
81 Survived on 6/6/14

105 specified in Planting Plan
77% survival

Results 2015

115 Trees planted in 2013
47 Dead on 6/11/15
18 Missing on 6/11/15
50 Survived 6/11/15

105 specified in Planting Plan
48% survival

[1] E - excellent, new growth; G - good, survival expected; F - fair, stressed; P - poor, severly stressed; D - dead
[2] L - light, < 25% affected; M - moderate, 25-50% affected; S - severe, > 50% affected
