Surrogate Quality Control

Surrogate recoveries which are outside of the QC window are confirmed unless attributed to dilution or otherwise noted on the Analysis Report. For dual column analyses, the surrogate (at least one surrogate for multi-surrogate tests) must be within the acceptance limits on at least one of the two columns.

*- Outside of specification

Surrogate Quality Control

Surrogate recoveries which are outside of the QC window are confirmed unless attributed to dilution or otherwise noted on the Analysis Report. For dual column analyses, the surrogate (at least one surrogate for multi-surrogate tests) must be within the acceptance limits on at least one of the two columns.

Explanation of Symbols and Abbreviations

The following defines common symbols and abbreviations used in reporting technical data:

BMQL	Below Minimum Quantitation Level	**mg**	milligram(s)
C	degrees Celsius	**mL**	milliliter(s)
cfu	colony forming units	**MPN**	Most Probable Number
CP Units	cobalt-chloroplatinate units	**N.D.**	non-detect
F	degrees Fahrenheit	**ng**	nanogram(s)
g	gram(s)	**NTU**	nephelometric turbidity units
IU	International Units	**pg/L**	picogram/liter
kg	kilogram(s)	**RL**	Reporting Limit
L	liter(s)	**TNTC**	Too Numerous To Count
lb.	pound(s)	**µg**	microgram(s)
m3	cubic meter(s)	**µL**	microliter(s)
meq	milliequivalents	**umhos/cm**	micromhos/cm

<	less than
>	greater than
ppm	parts per million - One ppm is equivalent to one milligram per kilogram (mg/kg) or one gram per million grams. For aqueous liquids, ppm is usually taken to be equivalent to milligrams per liter (mg/l), because one liter of water has a weight very close to a kilogram. For gases or vapors, one ppm is equivalent to one microliter per liter of gas.
ppb	parts per billion
Dry weight basis	Results printed under this heading have been adjusted for moisture content. This increases the analyte weight concentration to approximate the value present in a similar sample without moisture. All other results are reported on an as-received basis.

Analytical test results meet all requirements of the associated regulatory program (i.e., NELAC (TNI), DoD, and ISO 17025) unless otherwise noted under the individual analysis.

Measurement uncertainty values, as applicable, are available upon request.

Tests results relate only to the sample tested. Clients should be aware that a critical step in a chemical or microbiological analysis is the collection of the sample. Unless the sample analyzed is truly representative of the bulk of material involved, the test results will be meaningless. If you have questions regarding the proper techniques of collecting samples, please contact us. We cannot be held responsible for sample integrity, however, unless sampling has been performed by a member of our staff.

This report shall not be reproduced except in full, without the written approval of the laboratory.

Times are local to the area of activity. Parameters listed in the 40 CFR Part 136 Table II as “analyze immediately” are not performed within 15 minutes.

WARRANTY AND LIMITS OF LIABILITY - In accepting analytical work, we warrant the accuracy of test results for the sample as submitted. THE FOREGOING EXPRESS WARRANTY IS EXCLUSIVE AND IS GIVEN IN LIEU OF ALL OTHER WARRANTIES, EXPRESSED OR IMPLIED. WE DISCLAIM ANY OTHER WARRANTIES, EXPRESSED OR IMPLIED, INCLUDING A WARRANTY OF FITNESS FOR PARTICULAR PURPOSE AND WARRANTY OF MERCHANTABILITY. IN NO EVENT SHALL EUROFINS LANCASTER LABORATORIES ENVIRONMENTAL, LLC BE LIABLE FOR INDIRECT, SPECIAL, CONSEQUENTIAL, OR INCIDENTAL DAMAGES INCLUDING, BUT NOT LIMITED TO, DAMAGES FOR LOSS OF PROFIT OR GOODWILL REGARDLESS OF (A) THE NEGLIGENCE (EITHER SOLE OR CONCURRENT) OF EUROFINS LANCASTER LABORATORIES ENVIRONMENTAL AND (B) WHETHER EUROFINS LANCASTER LABORATORIES ENVIRONMENTAL HAS BEEN INFORMED OF THE POSSIBILITY OF SUCH DAMAGES. We accept no legal responsibility for the purposes for which the client uses the test results. No purchase order or other order for work shall be accepted by Eurofins Lancaster Laboratories Environmental which includes any conditions that vary from the Standard Terms and Conditions, and Eurofins Lancaster Laboratories Environmental hereby objects to any conflicting terms contained in any acceptance or order submitted by client.

Data Qualifiers

Qualifier	Definition
C	Result confirmed by reanalysis
D1	Indicates for dual column analyses that the result is reported from column 1
D2	Indicates for dual column analyses that the result is reported from column 2
E	Concentration exceeds the calibration range
J (or G, I, X)	Estimated value >= the Method Detection Limit (MDL or DL) and < the Limit of Quantitation (LOQ or RL)
P	Concentration difference between the primary and confirmation column >40%. The lower result is reported.
U	Analyte was not detected at the value indicated
V	Concentration difference between the primary and confirmation column >100%. The reporting limit is raised due to this disparity and evident interference.
W	The dissolved oxygen uptake for the unseeded blank is greater than 0.20 mg/L.
Z	Laboratory Defined - see analysis report

Additional Organic and Inorganic CLP qualifiers may be used with Form 1 reports as defined by the CLP methods.
Qualifiers specific to Dioxin/Furans and PCB Congeners are detailed on the individual Analysis Report.

General Comments:

See the Laboratory Sample Analysis Record section of the Analysis Report for the method references.

All QC met criteria unless otherwise noted in an Analysis Specific Comment below.

Refer to the QC Summary for specific values and acceptance criteria.

Project specific QC samples are not included in this data set.

Matrix QC may not be reported if site-specific QC samples were not submitted. In these situations, to demonstrate precision and accuracy at a batch level, a LCS/LCSD was performed, unless otherwise specified in the method.

Surrogate recoveries (if applicable) which are outside of the QC window are confirmed unless attributed to a dilution or otherwise noted in an Analysis Specific Comment below.

For dual column analyses, the surrogate (for multi-surrogate tests, at least one surrogate) must be within the acceptance limits on at least one of the two columns.

The samples were received at the appropriate temperature and in accordance with the chain of custody unless otherwise noted.

Analysis Specific Comments:

EPA 537 Version 1.1 Modified, Misc. Organics

Sample #s: 9288541, 9288542

The stated QC limits are advisory only until sufficient data points can be obtained to calculate statistical limits.

Batch #: 17302001 (Sample number(s): 9288541-9288542)

The recovery(ies) for the following analyte(s) in the LCS and/or LCSD exceeded the acceptance window indicating a positive bias: NEtFOSAA, NMeFOSAA, Perfluorooctanesulfonamide

The recovery(ies) for one or more surrogates were below the acceptance window for sample(s) 9288541, 9288542, Blank, LCS, LCSD

Quality Control Summary

Client Name: C. T. Male Associates
Reported: 10/30/2017 16:11

Group Number: 1868533

Matrix QC may not be reported if insufficient sample or site-specific QC samples were not submitted. In these situations, to demonstrate precision and accuracy at a batch level, a LCS/LCSD was performed, unless otherwise specified in the method.

All Inorganic Initial Calibration and Continuing Calibration Blanks met acceptable method criteria unless otherwise noted on the Analysis Report.

Method Blank

Analysis Name	Result ng/l	MDL** ng/l	LOQ ng/l
Batch number: 17302001	Sample number(s): 9288541-9288542		
6:2 fluorotelomersulfonate	3 U	3	6
8:2 fluorotelomersulfonate	2 U	2	6

Explanation of Symbols and Abbreviations

The following defines common symbols and abbreviations used in reporting technical data:

BMQL	Below Minimum Quantitation Level	**mg**	milligram(s)
C	degrees Celsius	**mL**	milliliter(s)
cfu	colony forming units	**MPN**	Most Probable Number
CP Units	cobalt-chloroplatinate units	**N.D.**	non-detect
F	degrees Fahrenheit	**ng**	nanogram(s)
g	gram(s)	**NTU**	nephelometric turbidity units
IU	International Units	**pg/L**	picogram/liter
kg	kilogram(s)	**RL**	Reporting Limit
L	liter(s)	**TNTC**	Too Numerous To Count
lb.	pound(s)	**µg**	microgram(s)
m3	cubic meter(s)	**µL**	microliter(s)
meq	milliequivalents	**umhos/cm**	micromhos/cm

<	less than
>	greater than
ppm	parts per million - One ppm is equivalent to one milligram per kilogram (mg/kg) or one gram per million grams. For aqueous liquids, ppm is usually taken to be equivalent to milligrams per liter (mg/l), because one liter of water has a weight very close to a kilogram. For gases or vapors, one ppm is equivalent to one microliter per liter of gas.
ppb	parts per billion
Dry weight basis	Results printed under this heading have been adjusted for moisture content. This increases the analyte weight concentration to approximate the value present in a similar sample without moisture. All other results are reported on an as-received basis.

Analytical test results meet all requirements of the associated regulatory program (i.e., NELAC (TNI), DoD, and ISO 17025) unless otherwise noted under the individual analysis.

Measurement uncertainty values, as applicable, are available upon request.

Tests results relate only to the sample tested. Clients should be aware that a critical step in a chemical or microbiological analysis is the collection of the sample. Unless the sample analyzed is truly representative of the bulk of material involved, the test results will be meaningless. If you have questions regarding the proper techniques of collecting samples, please contact us. We cannot be held responsible for sample integrity, however, unless sampling has been performed by a member of our staff.

This report shall not be reproduced except in full, without the written approval of the laboratory.

Times are local to the area of activity. Parameters listed in the 40 CFR Part 136 Table II as “analyze immediately” are not performed within 15 minutes.

WARRANTY AND LIMITS OF LIABILITY - In accepting analytical work, we warrant the accuracy of test results for the sample as submitted. THE FOREGOING EXPRESS WARRANTY IS EXCLUSIVE AND IS GIVEN IN LIEU OF ALL OTHER WARRANTIES, EXPRESSED OR IMPLIED. WE DISCLAIM ANY OTHER WARRANTIES, EXPRESSED OR IMPLIED, INCLUDING A WARRANTY OF FITNESS FOR PARTICULAR PURPOSE AND WARRANTY OF MERCHANTABILITY. IN NO EVENT SHALL EUROFINS LANCASTER LABORATORIES ENVIRONMENTAL, LLC BE LIABLE FOR INDIRECT, SPECIAL, CONSEQUENTIAL, OR INCIDENTAL DAMAGES INCLUDING, BUT NOT LIMITED TO, DAMAGES FOR LOSS OF PROFIT OR GOODWILL REGARDLESS OF (A) THE NEGLIGENCE (EITHER SOLE OR CONCURRENT) OF EUROFINS LANCASTER LABORATORIES ENVIRONMENTAL AND (B) WHETHER EUROFINS LANCASTER LABORATORIES ENVIRONMENTAL HAS BEEN INFORMED OF THE POSSIBILITY OF SUCH DAMAGES. We accept no legal responsibility for the purposes for which the client uses the test results. No purchase order or other order for work shall be accepted by Eurofins Lancaster Laboratories Environmental which includes any conditions that vary from the Standard Terms and Conditions, and Eurofins Lancaster Laboratories Environmental hereby objects to any conflicting terms contained in any acceptance or order submitted by client.

eurofins | Lancaster Laboratories Environmental

Data Qualifiers

Qualifier	Definition
C	Result confirmed by reanalysis
D1	Indicates for dual column analyses that the result is reported from column 1
D2	Indicates for dual column analyses that the result is reported from column 2
E	Concentration exceeds the calibration range
J (or G, I, X)	Estimated value >= the Method Detection Limit (MDL or DL) and < the Limit of Quantitation (LOQ or RL)
P	Concentration difference between the primary and confirmation column >40%. The lower result is reported.
U	Analyte was not detected at the value indicated
V	Concentration difference between the primary and confirmation column >100%. The reporting limit is raised due to this disparity and evident interference.
W	The dissolved oxygen uptake for the unseeded blank is greater than 0.20 mg/L.
Z	Laboratory Defined - see analysis report

Additional Organic and Inorganic CLP qualifiers may be used with Form 1 reports as defined by the CLP methods.
Qualifiers specific to Dioxin/Furans and PCB Congeners are detailed on the individual Analysis Report.

General Comments:

See the Laboratory Sample Analysis Record section of the Analysis Report for the method references.

All QC met criteria unless otherwise noted in an Analysis Specific Comment below.
Refer to the QC Summary for specific values and acceptance criteria.

Project specific QC samples are not included in this data set.

Matrix QC may not be reported if site-specific QC samples were not submitted. In these situations, to demonstrate precision and accuracy at a batch level, a LCS/LCSD was performed, unless otherwise specified in the method.

Surrogate recoveries (if applicable) which are outside of the QC window are confirmed unless attributed to a dilution or otherwise noted in an Analysis Specific Comment below.

For dual column analyses, the surrogate (for multi-surrogate tests, at least one surrogate) must be within the acceptance limits on at least one of the two columns.

The samples were received at the appropriate temperature and in accordance with the chain of custody unless otherwise noted.

Analysis Specific Comments:

EPA 537 Version 1.1 Modified, Misc. Organics

Sample #s: 9288593, 9288594, 9288595, 9288596, 9288597, 9288599

The stated QC limits are advisory only until sufficient data points can be obtained to calculate statistical limits.

Sample #s: 9288598

The stated QC limits are advisory only until sufficient data points can be obtained to calculate statistical limits.

The recovery for labeled compound used as extraction standard 13C2-PFTeDA is outside of QC acceptance limits as noted on the QC Summary. The data quality is not impacted by this result.

Batch #: 17302007 (Sample number(s): 9288597 UNSPK: P283924)

The recovery(ies) for the following analyte(s) in the LCS exceeded the acceptance window indicating a positive bias: NEtFOSAA, NMeFOSAA, Perfluorooctanesulfonamide

The recovery(ies) for the following analyte(s) in the MS and/or MSD exceeded the acceptance window indicating a positive bias: Perfluorooctanoic acid, Perfluorobutanoic acid, NEtFOSAA, NMeFOSAA, Perfluorooctanesulfonamide

The recovery(ies) for one or more surrogates were below the acceptance window for sample(s) 9288597, Blank, LCS, MS, MSD

Batch #: 17303007 (Sample number(s): 9288593-9288596, 9288599)

The recovery(ies) for the following analyte(s) in the LCS and/or LCSD exceeded the acceptance window indicating a positive bias: NEtFOSAA, NMeFOSAA, Perfluorooctanesulfonamide

The recovery(ies) for one or more surrogates were below the acceptance window for sample(s) 9288593,

The stated QC limits are advisory only until sufficient data points can be obtained to calculate statistical limits.

The recovery for labeled compound used as extraction standard 13C2-PFTeDA is outside of QC acceptance limits as noted on the QC Summary. The data quality is not impacted by this result.

Sample Comments

All QC is compliant unless otherwise noted. Please refer to the Quality Control Summary for overall QC performance data and associated samples.

Quality Control Summary

Client Name: C. T. Male Associates
Reported: 11/11/2017 09:17

Group Number: 1868544

Matrix QC may not be reported if insufficient sample or site-specific QC samples were not submitted. In these situations, to demonstrate precision and accuracy at a batch level, a LCS/LCSD was performed, unless otherwise specified in the method.

All Inorganic Initial Calibration and Continuing Calibration Blanks met acceptable method criteria unless otherwise noted on the Analysis Report.

Surrogate Quality Control

Surrogate recoveries which are outside of the QC window are confirmed unless attributed to dilution or otherwise noted on the Analysis Report. For dual column analyses, the surrogate (at least one surrogate for multi-surrogate tests) must be within the acceptance limits on at least one of the two columns.

Surrogate Quality Control (continued)

Surrogate recoveries which are outside of the QC window are confirmed unless attributed to dilution or otherwise noted on the Analysis Report. For dual column analyses, the surrogate (at least one surrogate for multi-surrogate tests) must be within the acceptance limits on at least one of the two columns.

Analysis Name: 19 PFAS Compounds
Batch number: 17312003

	13C2-6:2-FTS	13C8-PFOA	13C8-PFOS	13C9-PFNA	13C6-PFDA	13C2-8:2-FTS

Limits:	17-120	30-128	21-135	28-127	26-119	70-130

*- Outside of specification
**-This limit was used in the evaluation of the final result for the blank
(1) The result for one or both determinations was less than five times the LOQ.
(2) The unspiked result was more than four times the spike added.
P###### is indicative of a Background or Unspiked sample that is batch matrix QC and was not performed using a sample from this submission group.

Explanation of Symbols and Abbreviations

The following defines common symbols and abbreviations used in reporting technical data:

BMQL	Below Minimum Quantitation Level	**mg**	milligram(s)
C	degrees Celsius	**mL**	milliliter(s)
cfu	colony forming units	**MPN**	Most Probable Number
CP Units	cobalt-chloroplatinate units	**N.D.**	non-detect
F	degrees Fahrenheit	**ng**	nanogram(s)
g	gram(s)	**NTU**	nephelometric turbidity units
IU	International Units	**pg/L**	picogram/liter
kg	kilogram(s)	**RL**	Reporting Limit
L	liter(s)	**TNTC**	Too Numerous To Count
lb.	pound(s)	**µg**	microgram(s)
m3	cubic meter(s)	**µL**	microliter(s)
meq	milliequivalents	**umhos/cm**	micromhos/cm

<	less than
>	greater than
ppm	parts per million - One ppm is equivalent to one milligram per kilogram (mg/kg) or one gram per million grams. For aqueous liquids, ppm is usually taken to be equivalent to milligrams per liter (mg/l), because one liter of water has a weight very close to a kilogram. For gases or vapors, one ppm is equivalent to one microliter per liter of gas.
ppb	parts per billion
Dry weight basis	Results printed under this heading have been adjusted for moisture content. This increases the analyte weight concentration to approximate the value present in a similar sample without moisture. All other results are reported on an as-received basis.

Analytical test results meet all requirements of the associated regulatory program (i.e., NELAC (TNI), DoD, and ISO 17025) unless otherwise noted under the individual analysis.

Measurement uncertainty values, as applicable, are available upon request.

Tests results relate only to the sample tested. Clients should be aware that a critical step in a chemical or microbiological analysis is the collection of the sample. Unless the sample analyzed is truly representative of the bulk of material involved, the test results will be meaningless. If you have questions regarding the proper techniques of collecting samples, please contact us. We cannot be held responsible for sample integrity, however, unless sampling has been performed by a member of our staff.

This report shall not be reproduced except in full, without the written approval of the laboratory.

Times are local to the area of activity. Parameters listed in the 40 CFR Part 136 Table II as “analyze immediately” are not performed within 15 minutes.

WARRANTY AND LIMITS OF LIABILITY - In accepting analytical work, we warrant the accuracy of test results for the sample as submitted. THE FOREGOING EXPRESS WARRANTY IS EXCLUSIVE AND IS GIVEN IN LIEU OF ALL OTHER WARRANTIES, EXPRESSED OR IMPLIED. WE DISCLAIM ANY OTHER WARRANTIES, EXPRESSED OR IMPLIED, INCLUDING A WARRANTY OF FITNESS FOR PARTICULAR PURPOSE AND WARRANTY OF MERCHANTABILITY. IN NO EVENT SHALL EUROFINS LANCASTER LABORATORIES ENVIRONMENTAL, LLC BE LIABLE FOR INDIRECT, SPECIAL, CONSEQUENTIAL, OR INCIDENTAL DAMAGES INCLUDING, BUT NOT LIMITED TO, DAMAGES FOR LOSS OF PROFIT OR GOODWILL REGARDLESS OF (A) THE NEGLIGENCE (EITHER SOLE OR CONCURRENT) OF EUROFINS LANCASTER LABORATORIES ENVIRONMENTAL AND (B) WHETHER EUROFINS LANCASTER LABORATORIES ENVIRONMENTAL HAS BEEN INFORMED OF THE POSSIBILITY OF SUCH DAMAGES. We accept no legal responsibility for the purposes for which the client uses the test results. No purchase order or other order for work shall be accepted by Eurofins Lancaster Laboratories Environmental which includes any conditions that vary from the Standard Terms and Conditions, and Eurofins Lancaster Laboratories Environmental hereby objects to any conflicting terms contained in any acceptance or order submitted by client.

Data Qualifiers

Qualifier	Definition
C	Result confirmed by reanalysis
D1	Indicates for dual column analyses that the result is reported from column 1
D2	Indicates for dual column analyses that the result is reported from column 2
E	Concentration exceeds the calibration range
J (or G, I, X)	Estimated value >= the Method Detection Limit (MDL or DL) and < the Limit of Quantitation (LOQ or RL)
P	Concentration difference between the primary and confirmation column >40%. The lower result is reported.
U	Analyte was not detected at the value indicated
V	Concentration difference between the primary and confirmation column >100%. The reporting limit is raised due to this disparity and evident interference.
W	The dissolved oxygen uptake for the unseeded blank is greater than 0.20 mg/L.
Z	Laboratory Defined - see analysis report

Additional Organic and Inorganic CLP qualifiers may be used with Form 1 reports as defined by the CLP methods.
Qualifiers specific to Dioxin/Furans and PCB Congeners are detailed on the individual Analysis Report.

General Comments:

See the Laboratory Sample Analysis Record section of the Analysis Report for the method references.

All QC met criteria unless otherwise noted in an Analysis Specific Comment below.
Refer to the QC Summary for specific values and acceptance criteria.

Project specific QC samples are not included in this data set.

Matrix QC may not be reported if site-specific QC samples were not submitted. In these situations, to demonstrate precision and accuracy at a batch level, a LCS/LCSD was performed, unless otherwise specified in the method.

Surrogate recoveries (if applicable) which are outside of the QC window are confirmed unless attributed to a dilution or otherwise noted in an Analysis Specific Comment below.

For dual column analyses, the surrogate (for multi-surrogate tests, at least one surrogate) must be within the acceptance limits on at least one of the two columns.

The samples were received at the appropriate temperature and in accordance with the chain of custody unless otherwise noted.

Analysis Specific Comments:

SW-846 8260C, GC/MS Volatiles

Sample #s: 9288603

A Method Detection Limit (MDL) standard is analyzed to confirm sensitivity of the instrument for samples with non-detect analytes associated with a continuing calibration verification standard exhibiting low response (outside the 20%D criteria). The MDL standard shows adequate sensitivity at or below the reporting limit.

Batch #: 5173103AA (Sample number(s): 9288603 UNSPK: P300791)

The recovery(ies) for the following analyte(s) in the MS and/or MSD exceeded the acceptance window indicating a positive bias: Cyclohexane, Methylcyclohexane, 1,1,1-Trichloroethane, Carbon Tetrachloride, Freon 113

SW-846 8270D SIM, GC/MS Semivolatiles

Sample #s: 9288603

The stated QC limits are advisory only until sufficient data points can be obtained to calculate statistical limits.
Target analytes were detected in the method blank associated with the samples as noted on the QC Summary. The following corrective action was taken:
The sample was re-extracted and the target analytes were detected again in the method blank. THere is insufficient sample to re-extract again.
The client was contact and the data is reported from the initial trial.

Batch #: 17303WAE026 (Sample number(s): 9288603)

The recovery(ies) for one or more surrogates were below the acceptance window for sample(s) 9288603, Blank, LCS, LCSD

EPA 537 Version 1.1 Modified, Misc. Organics

Sample #s: 9288600, 9288601, 9288603

The stated QC limits are advisory only until sufficient data points can be obtained to calculate statistical limits.

Sample #s: 9288602

The stated QC limits are advisory only until sufficient data points can be obtained to calculate statistical limits.

Native compound PFDA is a "J" level detection in this trip blank. This trip blank was not re-extracted.

Batch #: 17303007 (Sample number(s): 9288600-9288603)

The recovery(ies) for the following analyte(s) in the LCS and/or LCSD exceeded the acceptance window indicating a positive bias: NEtFOSAA, NMeFOSAA, Perfluorooctanesulfonamide

The recovery(ies) for one or more surrogates were below the acceptance window for sample(s) 9288600, 9288601, 9288602, 9288603, Blank, LCS, LCSD

SW-846 6010C, Metals

Batch #: 173051063502 (Sample number(s): 9288600, 9288603 UNSPK: P291231 BKG: P291231)

The recovery(ies) for the following analyte(s) in the MS and/or MSD were below the acceptance window: Calcium

SW-846 6020A, Metals

Batch #: 173051063902A (Sample number(s): 9288600, 9288603 UNSPK: P285342 BKG: P285342)

The duplicate RPD for the following analyte(s) exceeded the acceptance window: Copper

EPA 300.0, Wet Chemistry

Batch #: 17301987106A (Sample number(s): 9288600, 9288603 UNSPK: 9288603 BKG: 9288603)

The duplicate RPD for the following analyte(s) exceeded the acceptance window: Chloride

A Method Detection Limit (MDL) standard is analyzed to confirm sensitivity of the instrument for samples with non-detect analytes associated with a continuing calibration verification standard exhibiting low response (outside the 20%D criteria). The MDL standard shows adequate sensitivity at or below the reporting limit.

GC/MS Semivolatiles	**SW-846 8270D SIM**		**ug/l**	**ug/l**	**ug/l**	
14080	**1,4-Dioxane**	123-91-1	**0.072 J**	0.050	0.20	1

The stated QC limits are advisory only until sufficient data points can be obtained to calculate statistical limits.
Target analytes were detected in the method blank associated with the samples as noted on the QC Summary. The following corrective action was taken:
The sample was re-extracted and the target analytes were detected again in the method blank. THere is insufficient sample to re-extract again.
The client was contact and the data is reported from the initial trial.

Quality Control Summary

Client Name: C. T. Male Associates
Reported: 11/15/2017 16:19

Group Number: 1868545

Matrix QC may not be reported if insufficient sample or site-specific QC samples were not submitted. In these situations, to demonstrate precision and accuracy at a batch level, a LCS/LCSD was performed, unless otherwise specified in the method.

All Inorganic Initial Calibration and Continuing Calibration Blanks met acceptable method criteria unless otherwise noted on the Analysis Report.

Sample Administration Receipt Documentation Log

Doc Log ID: 199191

Group Number(s): 1868545

Client: Barr Engineering

Delivery and Receipt Information

Delivery Method:	Fed Ex	Arrival Timestamp:	10/28/2017 10:00
Number of Packages:	2	Number of Projects:	1
State/Province of Origin:	VT		

Arrival Condition Summary

Shipping Container Sealed:	Yes	Sample IDs on COC match Containers:	Yes
Custody Seal Present:	Yes	Sample Date/Times match COC:	Yes
Custody Seal Intact:	Yes	VOA Vial Headspace ≥ 6mm:	No
Samples Chilled:	Yes	Total Trip Blank Qty:	4
Paperwork Enclosed:	Yes	Trip Blank Type:	See Below
Samples Intact:	Yes	Air Quality Samples Present:	No
Missing Samples:	No		
Extra Samples:	No		
Discrepancy in Container Qty on COC:	No		

Trip Blank Type(s): 2 Unpres. + 2 Trizma

Unpacked by Wyatt Shiffler (12792) at 11:17 on 10/28/2017

Samples Chilled Details

Thermometer Types: DT = Digital (Temp. Bottle) IR = Infrared (Surface Temp) All Temperatures in °C.

Cooler #	Thermometer ID	Corrected Temp	Therm. Type	Ice Type	Ice Present?	Ice Container	Elevated Temp?

Explanation of Symbols and Abbreviations

The following defines common symbols and abbreviations used in reporting technical data:

BMQL	Below Minimum Quantitation Level	**mg**	milligram(s)
C	degrees Celsius	**mL**	milliliter(s)
cfu	colony forming units	**MPN**	Most Probable Number
CP Units	cobalt-chloroplatinate units	**N.D.**	non-detect
F	degrees Fahrenheit	**ng**	nanogram(s)
g	gram(s)	**NTU**	nephelometric turbidity units
IU	International Units	**pg/L**	picogram/liter
kg	kilogram(s)	**RL**	Reporting Limit
L	liter(s)	**TNTC**	Too Numerous To Count
lb.	pound(s)	**µg**	microgram(s)
m3	cubic meter(s)	**µL**	microliter(s)
meq	milliequivalents	**umhos/cm**	micromhos/cm

<	less than
>	greater than
ppm	parts per million - One ppm is equivalent to one milligram per kilogram (mg/kg) or one gram per million grams. For aqueous liquids, ppm is usually taken to be equivalent to milligrams per liter (mg/l), because one liter of water has a weight very close to a kilogram. For gases or vapors, one ppm is equivalent to one microliter per liter of gas.
ppb	parts per billion
Dry weight basis	Results printed under this heading have been adjusted for moisture content. This increases the analyte weight concentration to approximate the value present in a similar sample without moisture. All other results are reported on an as-received basis.

Analytical test results meet all requirements of the associated regulatory program (i.e., NELAC (TNI), DoD, and ISO 17025) unless otherwise noted under the individual analysis.

Measurement uncertainty values, as applicable, are available upon request.

Tests results relate only to the sample tested. Clients should be aware that a critical step in a chemical or microbiological analysis is the collection of the sample. Unless the sample analyzed is truly representative of the bulk of material involved, the test results will be meaningless. If you have questions regarding the proper techniques of collecting samples, please contact us. We cannot be held responsible for sample integrity, however, unless sampling has been performed by a member of our staff.

This report shall not be reproduced except in full, without the written approval of the laboratory.

Times are local to the area of activity. Parameters listed in the 40 CFR Part 136 Table II as “analyze immediately” are not performed within 15 minutes.

WARRANTY AND LIMITS OF LIABILITY - In accepting analytical work, we warrant the accuracy of test results for the sample as submitted. THE FOREGOING EXPRESS WARRANTY IS EXCLUSIVE AND IS GIVEN IN LIEU OF ALL OTHER WARRANTIES, EXPRESSED OR IMPLIED. WE DISCLAIM ANY OTHER WARRANTIES, EXPRESSED OR IMPLIED, INCLUDING A WARRANTY OF FITNESS FOR PARTICULAR PURPOSE AND WARRANTY OF MERCHANTABILITY. IN NO EVENT SHALL EUROFINS LANCASTER LABORATORIES ENVIRONMENTAL, LLC BE LIABLE FOR INDIRECT, SPECIAL, CONSEQUENTIAL, OR INCIDENTAL DAMAGES INCLUDING, BUT NOT LIMITED TO, DAMAGES FOR LOSS OF PROFIT OR GOODWILL REGARDLESS OF (A) THE NEGLIGENCE (EITHER SOLE OR CONCURRENT) OF EUROFINS LANCASTER LABORATORIES ENVIRONMENTAL AND (B) WHETHER EUROFINS LANCASTER LABORATORIES ENVIRONMENTAL HAS BEEN INFORMED OF THE POSSIBILITY OF SUCH DAMAGES. We accept no legal responsibility for the purposes for which the client uses the test results. No purchase order or other order for work shall be accepted by Eurofins Lancaster Laboratories Environmental which includes any conditions that vary from the Standard Terms and Conditions, and Eurofins Lancaster Laboratories Environmental hereby objects to any conflicting terms contained in any acceptance or order submitted by client.

eurofins | Lancaster Laboratories Environmental

Data Qualifiers

Qualifier	Definition
C	Result confirmed by reanalysis
D1	Indicates for dual column analyses that the result is reported from column 1
D2	Indicates for dual column analyses that the result is reported from column 2
E	Concentration exceeds the calibration range
J (or G, I, X)	Estimated value >= the Method Detection Limit (MDL or DL) and < the Limit of Quantitation (LOQ or RL)
P	Concentration difference between the primary and confirmation column >40%. The lower result is reported.
U	Analyte was not detected at the value indicated
V	Concentration difference between the primary and confirmation column >100%. The reporting limit is raised due to this disparity and evident interference.
W	The dissolved oxygen uptake for the unseeded blank is greater than 0.20 mg/L.
Z	Laboratory Defined - see analysis report

Additional Organic and Inorganic CLP qualifiers may be used with Form 1 reports as defined by the CLP methods.
Qualifiers specific to Dioxin/Furans and PCB Congeners are detailed on the individual Analysis Report.

General Comments:

See the Laboratory Sample Analysis Record section of the Analysis Report for the method references.

All QC met criteria unless otherwise noted in an Analysis Specific Comment below.
Refer to the QC Summary for specific values and acceptance criteria.

Project specific QC samples are included in this data set.

Matrix QC may not be reported if site-specific QC samples were not submitted. In these situations, to demonstrate precision and accuracy at a batch level, a LCS/LCSD was performed, unless otherwise specified in the method.

Surrogate recoveries (if applicable) which are outside of the QC window are confirmed unless attributed to a dilution or otherwise noted in an Analysis Specific Comment below.

For dual column analyses, the surrogate (for multi-surrogate tests, at least one surrogate) must be within the acceptance limits on at least one of the two columns.

The samples were received at the appropriate temperature and in accordance with the chain of custody unless otherwise noted.

Analysis Specific Comments:

EPA 537 Version 1.1 Modified, Misc. Organics

Sample #s: 9291199, 9291203, 9291204, 9291205, 9291206

The stated QC limits are advisory only until sufficient data points can be obtained to calculate statistical limits.

Sample #s: 9291200, 9291201

The stated QC limits are advisory only until sufficient data points can be obtained to calculate statistical limits.

The recovery for the sample labeled compounds used as extraction standard(s) is outside the QC acceptance limits. The recovery for the labeled compounds used as extraction standards is also outside the QC acceptance limits in the associated matrix spike(s), indicating a matrix effect.

Batch #: 17307011 (Sample number(s): 9291199-9291201, 9291203-9291206 UNSPK: 9291199)

The relative percent difference(s) for the following analyte(s) in the MS/MSD were outside acceptance windows: Perfluoro-octanesulfonate

The recovery(ies) for one or more surrogates exceeded the acceptance window indicating a positive bias for sample(s) LCS

The recovery(ies) for one or more surrogates were below the acceptance window for sample(s) 9291199, 9291200, 9291201, 9291203, 9291204, 9291205, 9291206, MS, MSD

Batch #: 17310003 (Sample number(s): 9291197-9291198)

The recovery(ies) for the following analyte(s) in the LCS and/or LCSD exceeded the acceptance window indicating a positive bias: Perfluorotridecanoic acid

The relative percent difference(s) for the following analyte(s) in the LCS/LCSD were outside acceptance windows: Perfluoro-octanesulfonate. When the individual % recovery is within the acceptance limits, the data is reported.

SW-846 6010C, Metals

Batch #: 173061063701 (Sample number(s): 9291199-9291206 UNSPK: 9291199 BKG: 9291199)

The recovery(ies) for the following analyte(s) in the MS and/or MSD exceeded the acceptance window indicating a positive bias: Aluminum, Magnesium, Manganese

The recovery(ies) for the following analyte(s) in the MS and/or MSD were below the acceptance window: Magnesium

Batch #: 173111063701 (Sample number(s): 9291199-9291206 UNSPK: 9291199 BKG: 9291199)

The recovery(ies) for the following analyte(s) in the MS and/or MSD were below the acceptance window: Iron

SW-846 6020A, Metals

Batch #: 173061063701A (Sample number(s): 9291199-9291206 UNSPK: 9291199 BKG: 9291199)

The recovery(ies) for the following analyte(s) in the MS and/or MSD exceeded the acceptance window indicating a positive bias: Arsenic, Beryllium, Lead, Nickel, Thallium

The recovery(ies) for the following analyte(s) in the MS and/or MSD were below the acceptance window: Antimony

The relative percent difference(s) for the following analyte(s) in the MS/MSD were outside acceptance windows: Antimony, Cadmium

Batch #: 173061063701D (Sample number(s): 9291199-9291206 UNSPK: 9291199 BKG: 9291199)

The recovery(ies) for the following analyte(s) in the MS and/or MSD exceeded the acceptance window indicating a positive bias: Barium

Batch #: 173111063701A (Sample number(s): 9291199-9291206 UNSPK: 9291199 BKG: 9291199)

The recovery(ies) for the following analyte(s) in the MS and/or MSD exceeded the acceptance window indicating a positive bias: Copper, Vanadium

SM 5310 B modified-2000, Wet Chemistry

Sample #s: 9291203, 9291204, 9291205, 9291206

Due to the nature of this sample matrix, the sample cup was filled to capacity with less than 1000 mg of sample being used. The lowered sample weight has resulted in a raised reporting limit.

SW-846 9045D modified, Wet Chemistry

Sample #s: 9291199

The pH was measured in water at 19.2 C.

Sample #s: 9291202

The pH was measured in water at 19.5 C.

Sample #s: 9291203, 9291204, 9291206

The pH was measured in water at 19.7 C.

Sample #s: 9291205

2425 New Holland Pike, Lancaster, PA 17601 • 717-656-2300 • Fax: 717-656-6766 • www.EurofinsUS.com/LancLabsEnv

The pH was measured in water at 20 C.

The stated QC limits are advisory only until sufficient data points can be obtained to calculate statistical limits.

The recovery for the sample labeled compounds used as extraction standard(s) is outside the QC acceptance limits. The recovery for the labeled compounds used as extraction standards is also outside the QC acceptance limits in the associated matrix spike(s), indicating a matrix effect.

The stated QC limits are advisory only until sufficient data points can be obtained to calculate statistical limits.

The recovery for the sample labeled compounds used as extraction standard(s) is outside the QC acceptance limits. The recovery for the labeled compounds used as extraction standards is also outside the QC acceptance limits in the associated matrix spike(s), indicating a matrix effect.

Quality Control Summary

Client Name: C. T. Male Associates
Reported: 11/14/2017 10:34

Group Number: 1869094

Matrix QC may not be reported if insufficient sample or site-specific QC samples were not submitted. In these situations, to demonstrate precision and accuracy at a batch level, a LCS/LCSD was performed, unless otherwise specified in the method.

All Inorganic Initial Calibration and Continuing Calibration Blanks met acceptable method criteria unless otherwise noted on the Analysis Report.

Method Blank

Surrogate Quality Control

Surrogate recoveries which are outside of the QC window are confirmed unless attributed to dilution or otherwise noted on the Analysis Report. For dual column analyses, the surrogate (at least one surrogate for multi-surrogate tests) must be within the acceptance limits on at least one of the two columns.

Explanation of Symbols and Abbreviations

The following defines common symbols and abbreviations used in reporting technical data:

BMQL	Below Minimum Quantitation Level	**mg**	milligram(s)
C	degrees Celsius	**mL**	milliliter(s)
cfu	colony forming units	**MPN**	Most Probable Number
CP Units	cobalt-chloroplatinate units	**N.D.**	non-detect
F	degrees Fahrenheit	**ng**	nanogram(s)
g	gram(s)	**NTU**	nephelometric turbidity units
IU	International Units	**pg/L**	picogram/liter
kg	kilogram(s)	**RL**	Reporting Limit
L	liter(s)	**TNTC**	Too Numerous To Count
lb.	pound(s)	**µg**	microgram(s)
m3	cubic meter(s)	**µL**	microliter(s)
meq	milliequivalents	**umhos/cm**	micromhos/cm

<	less than
>	greater than
ppm	parts per million - One ppm is equivalent to one milligram per kilogram (mg/kg) or one gram per million grams. For aqueous liquids, ppm is usually taken to be equivalent to milligrams per liter (mg/l), because one liter of water has a weight very close to a kilogram. For gases or vapors, one ppm is equivalent to one microliter per liter of gas.
ppb	parts per billion
Dry weight basis	Results printed under this heading have been adjusted for moisture content. This increases the analyte weight concentration to approximate the value present in a similar sample without moisture. All other results are reported on an as-received basis.

Analytical test results meet all requirements of the associated regulatory program (i.e., NELAC (TNI), DoD, and ISO 17025) unless otherwise noted under the individual analysis.

Measurement uncertainty values, as applicable, are available upon request.

Tests results relate only to the sample tested. Clients should be aware that a critical step in a chemical or microbiological analysis is the collection of the sample. Unless the sample analyzed is truly representative of the bulk of material involved, the test results will be meaningless. If you have questions regarding the proper techniques of collecting samples, please contact us. We cannot be held responsible for sample integrity, however, unless sampling has been performed by a member of our staff.

This report shall not be reproduced except in full, without the written approval of the laboratory.

Times are local to the area of activity. Parameters listed in the 40 CFR Part 136 Table II as “analyze immediately” are not performed within 15 minutes.

WARRANTY AND LIMITS OF LIABILITY - In accepting analytical work, we warrant the accuracy of test results for the sample as submitted. THE FOREGOING EXPRESS WARRANTY IS EXCLUSIVE AND IS GIVEN IN LIEU OF ALL OTHER WARRANTIES, EXPRESSED OR IMPLIED. WE DISCLAIM ANY OTHER WARRANTIES, EXPRESSED OR IMPLIED, INCLUDING A WARRANTY OF FITNESS FOR PARTICULAR PURPOSE AND WARRANTY OF MERCHANTABILITY. IN NO EVENT SHALL EUROFINS LANCASTER LABORATORIES ENVIRONMENTAL, LLC BE LIABLE FOR INDIRECT, SPECIAL, CONSEQUENTIAL, OR INCIDENTAL DAMAGES INCLUDING, BUT NOT LIMITED TO, DAMAGES FOR LOSS OF PROFIT OR GOODWILL REGARDLESS OF (A) THE NEGLIGENCE (EITHER SOLE OR CONCURRENT) OF EUROFINS LANCASTER LABORATORIES ENVIRONMENTAL AND (B) WHETHER EUROFINS LANCASTER LABORATORIES ENVIRONMENTAL HAS BEEN INFORMED OF THE POSSIBILITY OF SUCH DAMAGES. We accept no legal responsibility for the purposes for which the client uses the test results. No purchase order or other order for work shall be accepted by Eurofins Lancaster Laboratories Environmental which includes any conditions that vary from the Standard Terms and Conditions, and Eurofins Lancaster Laboratories Environmental hereby objects to any conflicting terms contained in any acceptance or order submitted by client.

Data Qualifiers

Qualifier	Definition
C	Result confirmed by reanalysis
D1	Indicates for dual column analyses that the result is reported from column 1
D2	Indicates for dual column analyses that the result is reported from column 2
E	Concentration exceeds the calibration range
J (or G, I, X)	Estimated value >= the Method Detection Limit (MDL or DL) and < the Limit of Quantitation (LOQ or RL)
P	Concentration difference between the primary and confirmation column >40%. The lower result is reported.
U	Analyte was not detected at the value indicated
V	Concentration difference between the primary and confirmation column >100%. The reporting limit is raised due to this disparity and evident interference.
W	The dissolved oxygen uptake for the unseeded blank is greater than 0.20 mg/L.
Z	Laboratory Defined - see analysis report

Additional Organic and Inorganic CLP qualifiers may be used with Form 1 reports as defined by the CLP methods.
Qualifiers specific to Dioxin/Furans and PCB Congeners are detailed on the individual Analysis Report.

SAMPLE INFORMATION

Client Sample Description	Sample Collection Date/Time	ELLE#
SG3-D21-171031 Grab Groundwater	10/31/2017 10:25	9292936

The specific methodologies used in obtaining the enclosed analytical results are indicated on the Laboratory Sample Analysis Record.

2425 New Holland Pike, Lancaster, PA 17601 • 717-656-2300 • Fax: 717-656-6766 • www.EurofinsUS.com/LancLabsEnv

Project Name: SGPP - Bennington
ELLE Group #: 1869543

General Comments:

See the Laboratory Sample Analysis Record section of the Analysis Report for the method references.

All QC met criteria unless otherwise noted in an Analysis Specific Comment below.

Refer to the QC Summary for specific values and acceptance criteria.

Project specific QC samples are not included in this data set.

Matrix QC may not be reported if site-specific QC samples were not submitted. In these situations, to demonstrate precision and accuracy at a batch level, a LCS/LCSD was performed, unless otherwise specified in the method.

Surrogate recoveries (if applicable) which are outside of the QC window are confirmed unless attributed to a dilution or otherwise noted in an Analysis Specific Comment below.

For dual column analyses, the surrogate (for multi-surrogate tests, at least one surrogate) must be within the acceptance limits on at least one of the two columns.

The samples were received at the appropriate temperature and in accordance with the chain of custody unless otherwise noted.

Analysis Specific Comments:

No additional comments are necessary.

Quality Control Summary

Client Name: C. T. Male Associates
Group Number: 1869543
Reported: 11/02/2017 11:34

Matrix QC may not be reported if insufficient sample or site-specific QC samples were not submitted. In these situations, to demonstrate precision and accuracy at a batch level, a LCS/LCSD was performed, unless otherwise specified in the method.

All Inorganic Initial Calibration and Continuing Calibration Blanks met acceptable method criteria unless otherwise noted on the Analysis Report.

Method Blank

Analysis Name	Result	MDL**	LOQ
	mg/l	mg/l	mg/l
Batch number: 17306022601A	Sample number(s): 9292936		
Ortho-Phosphate as P	0.030 U	0.030	0.090

LCS/LCSD

Analysis Name	LCS Spike Added mg/l	LCS Conc mg/l	LCSD Spike Added mg/l	LCSD Conc mg/l	LCS %REC	LCSD %REC	LCS/LCSD Limits	RPD	RPD Max
Batch number: 17306022601A	Sample number(s): 9292936								
Ortho-Phosphate as P	0.400	0.410	0.400	0.398	102	100	95-105	3	4

Laboratory Duplicate

Background (BKG) = the sample used in conjunction with the duplicate

Analysis Name	BKG Conc mg/l	DUP Conc mg/l	DUP RPD	DUP RPD Max
Batch number: 17306022601A	Sample number(s): 9292936 BKG: P293787			
Ortho-Phosphate as P	0.528	0.511	3	6

*- Outside of specification
**-This limit was used in the evaluation of the final result for the blank
(1) The result for one or both determinations was less than five times the LOQ.
(2) The unspiked result was more than four times the spike added.
P###### is indicative of a Background or Unspiked sample that is batch matrix QC and was not performed using a sample from this submission group.

Explanation of Symbols and Abbreviations

The following defines common symbols and abbreviations used in reporting technical data:

BMQL	Below Minimum Quantitation Level	**mg**	milligram(s)
C	degrees Celsius	**mL**	milliliter(s)
cfu	colony forming units	**MPN**	Most Probable Number
CP Units	cobalt-chloroplatinate units	**N.D.**	non-detect
F	degrees Fahrenheit	**ng**	nanogram(s)
g	gram(s)	**NTU**	nephelometric turbidity units
IU	International Units	**pg/L**	picogram/liter
kg	kilogram(s)	**RL**	Reporting Limit
L	liter(s)	**TNTC**	Too Numerous To Count
lb.	pound(s)	**µg**	microgram(s)
m3	cubic meter(s)	**µL**	microliter(s)
meq	milliequivalents	**umhos/cm**	micromhos/cm

<	less than
>	greater than
ppm	parts per million - One ppm is equivalent to one milligram per kilogram (mg/kg) or one gram per million grams. For aqueous liquids, ppm is usually taken to be equivalent to milligrams per liter (mg/l), because one liter of water has a weight very close to a kilogram. For gases or vapors, one ppm is equivalent to one microliter per liter of gas.
ppb	parts per billion
Dry weight basis	Results printed under this heading have been adjusted for moisture content. This increases the analyte weight concentration to approximate the value present in a similar sample without moisture. All other results are reported on an as-received basis.

Analytical test results meet all requirements of the associated regulatory program (i.e., NELAC (TNI), DoD, and ISO 17025) unless otherwise noted under the individual analysis.

Measurement uncertainty values, as applicable, are available upon request.

Tests results relate only to the sample tested. Clients should be aware that a critical step in a chemical or microbiological analysis is the collection of the sample. Unless the sample analyzed is truly representative of the bulk of material involved, the test results will be meaningless. If you have questions regarding the proper techniques of collecting samples, please contact us. We cannot be held responsible for sample integrity, however, unless sampling has been performed by a member of our staff.

This report shall not be reproduced except in full, without the written approval of the laboratory.

Times are local to the area of activity. Parameters listed in the 40 CFR Part 136 Table II as “analyze immediately” are not performed within 15 minutes.

WARRANTY AND LIMITS OF LIABILITY - In accepting analytical work, we warrant the accuracy of test results for the sample as submitted. THE FOREGOING EXPRESS WARRANTY IS EXCLUSIVE AND IS GIVEN IN LIEU OF ALL OTHER WARRANTIES, EXPRESSED OR IMPLIED. WE DISCLAIM ANY OTHER WARRANTIES, EXPRESSED OR IMPLIED, INCLUDING A WARRANTY OF FITNESS FOR PARTICULAR PURPOSE AND WARRANTY OF MERCHANTABILITY. IN NO EVENT SHALL EUROFINS LANCASTER LABORATORIES ENVIRONMENTAL, LLC BE LIABLE FOR INDIRECT, SPECIAL, CONSEQUENTIAL, OR INCIDENTAL DAMAGES INCLUDING, BUT NOT LIMITED TO, DAMAGES FOR LOSS OF PROFIT OR GOODWILL REGARDLESS OF (A) THE NEGLIGENCE (EITHER SOLE OR CONCURRENT) OF EUROFINS LANCASTER LABORATORIES ENVIRONMENTAL AND (B) WHETHER EUROFINS LANCASTER LABORATORIES ENVIRONMENTAL HAS BEEN INFORMED OF THE POSSIBILITY OF SUCH DAMAGES. We accept no legal responsibility for the purposes for which the client uses the test results. No purchase order or other order for work shall be accepted by Eurofins Lancaster Laboratories Environmental which includes any conditions that vary from the Standard Terms and Conditions, and Eurofins Lancaster Laboratories Environmental hereby objects to any conflicting terms contained in any acceptance or order submitted by client.

eurofins | Lancaster Laboratories Environmental

Data Qualifiers

Qualifier	Definition
C	Result confirmed by reanalysis
D1	Indicates for dual column analyses that the result is reported from column 1
D2	Indicates for dual column analyses that the result is reported from column 2
E	Concentration exceeds the calibration range
J (or G, I, X)	Estimated value >= the Method Detection Limit (MDL or DL) and < the Limit of Quantitation (LOQ or RL)
P	Concentration difference between the primary and confirmation column >40%. The lower result is reported.
U	Analyte was not detected at the value indicated
V	Concentration difference between the primary and confirmation column >100%. The reporting limit is raised due to this disparity and evident interference.
W	The dissolved oxygen uptake for the unseeded blank is greater than 0.20 mg/L.
Z	Laboratory Defined - see analysis report

Additional Organic and Inorganic CLP qualifiers may be used with Form 1 reports as defined by the CLP methods.
Qualifiers specific to Dioxin/Furans and PCB Congeners are detailed on the individual Analysis Report.

General Comments:

See the Laboratory Sample Analysis Record section of the Analysis Report for the method references.

All QC met criteria unless otherwise noted in an Analysis Specific Comment below.
Refer to the QC Summary for specific values and acceptance criteria.

Project specific QC samples are not included in this data set.

Matrix QC may not be reported if site-specific QC samples were not submitted. In these situations, to demonstrate precision and accuracy at a batch level, a LCS/LCSD was performed, unless otherwise specified in the method.

Surrogate recoveries (if applicable) which are outside of the QC window are confirmed unless attributed to a dilution or otherwise noted in an Analysis Specific Comment below.

For dual column analyses, the surrogate (for multi-surrogate tests, at least one surrogate) must be within the acceptance limits on at least one of the two columns.

The samples were received at the appropriate temperature and in accordance with the chain of custody unless otherwise noted.

Analysis Specific Comments:

EPA 537 Version 1.1 Modified, Misc. Organics

Sample #s: 9294601, 9294602, 9294603, 9294604, 9294605, 9294606

The stated QC limits are advisory only until sufficient data points can be obtained to calculate statistical limits.

Sample #s: 9294598, 9294599, 9294600

The stated QC limits are advisory only until sufficient data points can be obtained to calculate statistical limits.

Z = The recovery for native compound PFTrDA is outside of QC acceptance limits in the closing calibration verification standard (CCV). Since the result is high and PFTrDA is not detected, the data is reported.

The recovery for labeled compound used as extraction standard 13C2-8:2-FTS is outside of QC acceptance limits in the closing calibration standard verification (CCV) associated with the LCS/LCSD.

Batch #: 17306003 (Sample number(s): 9294598-9294600)

The recovery(ies) for the following analyte(s) in the LCS and/or LCSD exceeded the acceptance window indicating a positive bias: NEtFOSAA, NMeFOSAA

The recovery(ies) for one or more surrogates were below the acceptance window for sample(s) 9294598, 9294599, 9294600, Blank, LCS, LCSD

Batch #: 17307011 (Sample number(s): 9294601-9294606 UNSPK: P291199)

The relative percent difference(s) for the following analyte(s) in the MS/MSD were outside acceptance windows: Perfluoro-octanesulfonate

The recovery(ies) for one or more surrogates exceeded the acceptance window indicating a positive bias for sample(s) LCS

The recovery(ies) for one or more surrogates were below the acceptance window for sample(s) 9294601, 9294602, 9294603, 9294604, 9294605, 9294606, MS, MSD

SW-846 6010C, Metals

Batch #: 173101063701 (Sample number(s): 9294601-9294606 UNSPK: 9294601 BKG: 9294601)

The recovery(ies) for the following analyte(s) in the MS and/or MSD exceeded the acceptance window indicating a positive bias: Aluminum, Magnesium

The recovery(ies) for the following analyte(s) in the MS and/or MSD were below the acceptance window: Iron, Calcium

The duplicate RPD for the following analyte(s) exceeded the acceptance window: Magnesium, Potassium

SW-846 6020A, Metals

Batch #: 173101063701A (Sample number(s): 9294601-9294606 UNSPK: 9294601 BKG: 9294601)

The recovery(ies) for the following analyte(s) in the MS and/or MSD exceeded the acceptance window indicating a positive bias: Arsenic, Lead

The recovery(ies) for the following analyte(s) in the MS and/or MSD were below the acceptance window: Antimony, Beryllium, Arsenic, Copper, Lead, Nickel

The relative percent difference(s) for the following analyte(s) in the MS/MSD were outside acceptance windows: Arsenic, Beryllium, Copper, Lead, Nickel

The duplicate RPD for the following analyte(s) exceeded the acceptance window: Chromium, Silver

Batch #: 173101063701D (Sample number(s): 9294601-9294606 UNSPK: 9294601 BKG: 9294601)

The recovery(ies) for the following analyte(s) in the MS and/or MSD exceeded the acceptance window indicating a positive bias: Barium

The recovery(ies) for the following analyte(s) in the MS and/or MSD were below the acceptance window: Barium

The relative percent difference(s) for the following analyte(s) in the MS/MSD were outside acceptance windows: Barium

SM 5310 B modified-2000, Wet Chemistry

Sample #s: 9294601, 9294602, 9294603, 9294606

Due to the nature of this sample matrix, the sample cup was filled to capacity with less than 1000 mg of sample being used. The lowered sample weight has resulted in a raised reporting limit.

Batch #: 17317667631B (Sample number(s): 9294601-9294605 UNSPK: P294448 BKG: P294448)

The duplicate RPD for the following analyte(s) exceeded the acceptance window: TOC Solids/Sludges Combustion

SW-846 9045D modified, Wet Chemistry

Sample #s: 9294606

The pH was measured in water at 19.9 C.

2425 New Holland Pike, Lancaster, PA 17601 • 717-656-2300 • Fax: 717-656-6766 • www.EurofinsUS.com/LancLabsEnv

Sample #s: 9294604, 9294605

The pH was measured in water at 20.2 C.

Sample #s: 9294603

The pH was measured in water at 20.4 C.

Sample #s: 9294601

The pH was measured in water at 20.5 C.

Sample #s: 9294602

The pH was measured in water at 20.6 C.

The stated QC limits are advisory only until sufficient data points can be obtained to calculate statistical limits.

Z = The recovery for native compound PFTrDA is outside of QC acceptance limits in the closing calibration verification standard (CCV). Since the result is high and PFTrDA is not detected, the data is reported.

The recovery for labeled compound used as extraction standard 13C2-8:2-FTS is outside of QC acceptance limits in the closing calibration standard verification (CCV) associated with the LCS/LCSD.

Sample Comments

All QC is compliant unless otherwise noted. Please refer to the Quality Control Summary for overall QC performance data and associated samples.

Quality Control Summary

Client Name: C. T. Male Associates
Reported: 11/15/2017 16:19

Group Number: 1869944

Matrix QC may not be reported if insufficient sample or site-specific QC samples were not submitted. In these situations, to demonstrate precision and accuracy at a batch level, a LCS/LCSD was performed, unless otherwise specified in the method.

All Inorganic Initial Calibration and Continuing Calibration Blanks met acceptable method criteria unless otherwise noted on the Analysis Report.

Method Blank

Explanation of Symbols and Abbreviations

The following defines common symbols and abbreviations used in reporting technical data:

BMQL	Below Minimum Quantitation Level	**mg**	milligram(s)
C	degrees Celsius	**mL**	milliliter(s)
cfu	colony forming units	**MPN**	Most Probable Number
CP Units	cobalt-chloroplatinate units	**N.D.**	non-detect
F	degrees Fahrenheit	**ng**	nanogram(s)
g	gram(s)	**NTU**	nephelometric turbidity units
IU	International Units	**pg/L**	picogram/liter
kg	kilogram(s)	**RL**	Reporting Limit
L	liter(s)	**TNTC**	Too Numerous To Count
lb.	pound(s)	**µg**	microgram(s)
m3	cubic meter(s)	**µL**	microliter(s)
meq	milliequivalents	**umhos/cm**	micromhos/cm

<	less than
>	greater than
ppm	parts per million - One ppm is equivalent to one milligram per kilogram (mg/kg) or one gram per million grams. For aqueous liquids, ppm is usually taken to be equivalent to milligrams per liter (mg/l), because one liter of water has a weight very close to a kilogram. For gases or vapors, one ppm is equivalent to one microliter per liter of gas.
ppb	parts per billion
Dry weight basis	Results printed under this heading have been adjusted for moisture content. This increases the analyte weight concentration to approximate the value present in a similar sample without moisture. All other results are reported on an as-received basis.

Analytical test results meet all requirements of the associated regulatory program (i.e., NELAC (TNI), DoD, and ISO 17025) unless otherwise noted under the individual analysis.

Measurement uncertainty values, as applicable, are available upon request.

Tests results relate only to the sample tested. Clients should be aware that a critical step in a chemical or microbiological analysis is the collection of the sample. Unless the sample analyzed is truly representative of the bulk of material involved, the test results will be meaningless. If you have questions regarding the proper techniques of collecting samples, please contact us. We cannot be held responsible for sample integrity, however, unless sampling has been performed by a member of our staff.

This report shall not be reproduced except in full, without the written approval of the laboratory.

Times are local to the area of activity. Parameters listed in the 40 CFR Part 136 Table II as “analyze immediately” are not performed within 15 minutes.

WARRANTY AND LIMITS OF LIABILITY - In accepting analytical work, we warrant the accuracy of test results for the sample as submitted. THE FOREGOING EXPRESS WARRANTY IS EXCLUSIVE AND IS GIVEN IN LIEU OF ALL OTHER WARRANTIES, EXPRESSED OR IMPLIED. WE DISCLAIM ANY OTHER WARRANTIES, EXPRESSED OR IMPLIED, INCLUDING A WARRANTY OF FITNESS FOR PARTICULAR PURPOSE AND WARRANTY OF MERCHANTABILITY. IN NO EVENT SHALL EUROFINS LANCASTER LABORATORIES ENVIRONMENTAL, LLC BE LIABLE FOR INDIRECT, SPECIAL, CONSEQUENTIAL, OR INCIDENTAL DAMAGES INCLUDING, BUT NOT LIMITED TO, DAMAGES FOR LOSS OF PROFIT OR GOODWILL REGARDLESS OF (A) THE NEGLIGENCE (EITHER SOLE OR CONCURRENT) OF EUROFINS LANCASTER LABORATORIES ENVIRONMENTAL AND (B) WHETHER EUROFINS LANCASTER LABORATORIES ENVIRONMENTAL HAS BEEN INFORMED OF THE POSSIBILITY OF SUCH DAMAGES. We accept no legal responsibility for the purposes for which the client uses the test results. No purchase order or other order for work shall be accepted by Eurofins Lancaster Laboratories Environmental which includes any conditions that vary from the Standard Terms and Conditions, and Eurofins Lancaster Laboratories Environmental hereby objects to any conflicting terms contained in any acceptance or order submitted by client.

Data Qualifiers

Qualifier	Definition
C	Result confirmed by reanalysis
D1	Indicates for dual column analyses that the result is reported from column 1
D2	Indicates for dual column analyses that the result is reported from column 2
E	Concentration exceeds the calibration range
J (or G, I, X)	Estimated value >= the Method Detection Limit (MDL or DL) and < the Limit of Quantitation (LOQ or RL)
P	Concentration difference between the primary and confirmation column >40%. The lower result is reported.
U	Analyte was not detected at the value indicated
V	Concentration difference between the primary and confirmation column >100%. The reporting limit is raised due to this disparity and evident interference.
W	The dissolved oxygen uptake for the unseeded blank is greater than 0.20 mg/L.
Z	Laboratory Defined - see analysis report

Additional Organic and Inorganic CLP qualifiers may be used with Form 1 reports as defined by the CLP methods.
Qualifiers specific to Dioxin/Furans and PCB Congeners are detailed on the individual Analysis Report.

Project Name: SGPP - Bennington
ELLE Group #: 1870175

General Comments:

See the Laboratory Sample Analysis Record section of the Analysis Report for the method references.

All QC met criteria unless otherwise noted in an Analysis Specific Comment below.

Refer to the QC Summary for specific values and acceptance criteria.

Project specific QC samples are not included in this data set.

Matrix QC may not be reported if site-specific QC samples were not submitted. In these situations, to demonstrate precision and accuracy at a batch level, a LCS/LCSD was performed, unless otherwise specified in the method.

Surrogate recoveries (if applicable) which are outside of the QC window are confirmed unless attributed to a dilution or otherwise noted in an Analysis Specific Comment below.

For dual column analyses, the surrogate (for multi-surrogate tests, at least one surrogate) must be within the acceptance limits on at least one of the two columns.

The samples were received at the appropriate temperature and in accordance with the chain of custody unless otherwise noted.

Analysis Specific Comments:

EPA 537 Version 1.1 Modified, Misc. Organics

Sample #s: 9295630

The stated QC limits are advisory only until sufficient data points can be obtained to calculate statistical limits.

The recovery for labeled compound used as extraction standard d5-NEtFOSAA is outside of QC acceptance limits in the closing calibration verifcation (CCV).

Batch #: 17306008 (Sample number(s): 9295630)

The recovery(ies) for the following analyte(s) in the LCS and/or LCSD exceeded the acceptance window indicating a positive bias: NMeFOSAA

The recovery(ies) for one or more surrogates were below the acceptance window for sample(s) 9295630, Blank, LCS, LCSD

Quality Control Summary

Client Name: C. T. Male Associates
Reported: 11/03/2017 13:17

Group Number: 1870175

Matrix QC may not be reported if insufficient sample or site-specific QC samples were not submitted. In these situations, to demonstrate precision and accuracy at a batch level, a LCS/LCSD was performed, unless otherwise specified in the method.

All Inorganic Initial Calibration and Continuing Calibration Blanks met acceptable method criteria unless otherwise noted on the Analysis Report.

Surrogate Quality Control

Surrogate recoveries which are outside of the QC window are confirmed unless attributed to dilution or otherwise noted on the Analysis Report. For dual column analyses, the surrogate (at least one surrogate for multi-surrogate tests) must be within the acceptance limits on at least one of the two columns.

Quality Control Summary

Client Name: C. T. Male Associates
Group Number: 1870175
Reported: 11/03/2017 13:17

Surrogate Quality Control (continued)

Surrogate recoveries which are outside of the QC window are confirmed unless attributed to dilution or otherwise noted on the Analysis Report. For dual column analyses, the surrogate (at least one surrogate for multi-surrogate tests) must be within the acceptance limits on at least one of the two columns.

Analysis Name: 19 PFAS Compounds
Batch number: 17306008

Limits:	17-120	30-128	21-135	28-127	26-119	70-130

*- Outside of specification
**-This limit was used in the evaluation of the final result for the blank
(1) The result for one or both determinations was less than five times the LOQ.
(2) The unspiked result was more than four times the spike added.
P###### is indicative of a Background or Unspiked sample that is batch matrix QC and was not performed using a sample from this submission group.

Explanation of Symbols and Abbreviations

The following defines common symbols and abbreviations used in reporting technical data:

BMQL	Below Minimum Quantitation Level	**mg**	milligram(s)
C	degrees Celsius	**mL**	milliliter(s)
cfu	colony forming units	**MPN**	Most Probable Number
CP Units	cobalt-chloroplatinate units	**N.D.**	non-detect
F	degrees Fahrenheit	**ng**	nanogram(s)
g	gram(s)	**NTU**	nephelometric turbidity units
IU	International Units	**pg/L**	picogram/liter
kg	kilogram(s)	**RL**	Reporting Limit
L	liter(s)	**TNTC**	Too Numerous To Count
lb.	pound(s)	**µg**	microgram(s)
m3	cubic meter(s)	**µL**	microliter(s)
meq	milliequivalents	**umhos/cm**	micromhos/cm

<	less than
>	greater than
ppm	parts per million - One ppm is equivalent to one milligram per kilogram (mg/kg) or one gram per million grams. For aqueous liquids, ppm is usually taken to be equivalent to milligrams per liter (mg/l), because one liter of water has a weight very close to a kilogram. For gases or vapors, one ppm is equivalent to one microliter per liter of gas.
ppb	parts per billion
Dry weight basis	Results printed under this heading have been adjusted for moisture content. This increases the analyte weight concentration to approximate the value present in a similar sample without moisture. All other results are reported on an as-received basis.

Analytical test results meet all requirements of the associated regulatory program (i.e., NELAC (TNI), DoD, and ISO 17025) unless otherwise noted under the individual analysis.

Measurement uncertainty values, as applicable, are available upon request.

Tests results relate only to the sample tested. Clients should be aware that a critical step in a chemical or microbiological analysis is the collection of the sample. Unless the sample analyzed is truly representative of the bulk of material involved, the test results will be meaningless. If you have questions regarding the proper techniques of collecting samples, please contact us. We cannot be held responsible for sample integrity, however, unless sampling has been performed by a member of our staff.

This report shall not be reproduced except in full, without the written approval of the laboratory.

Times are local to the area of activity. Parameters listed in the 40 CFR Part 136 Table II as “analyze immediately” are not performed within 15 minutes.

WARRANTY AND LIMITS OF LIABILITY - In accepting analytical work, we warrant the accuracy of test results for the sample as submitted. THE FOREGOING EXPRESS WARRANTY IS EXCLUSIVE AND IS GIVEN IN LIEU OF ALL OTHER WARRANTIES, EXPRESSED OR IMPLIED. WE DISCLAIM ANY OTHER WARRANTIES, EXPRESSED OR IMPLIED, INCLUDING A WARRANTY OF FITNESS FOR PARTICULAR PURPOSE AND WARRANTY OF MERCHANTABILITY. IN NO EVENT SHALL EUROFINS LANCASTER LABORATORIES ENVIRONMENTAL, LLC BE LIABLE FOR INDIRECT, SPECIAL, CONSEQUENTIAL, OR INCIDENTAL DAMAGES INCLUDING, BUT NOT LIMITED TO, DAMAGES FOR LOSS OF PROFIT OR GOODWILL REGARDLESS OF (A) THE NEGLIGENCE (EITHER SOLE OR CONCURRENT) OF EUROFINS LANCASTER LABORATORIES ENVIRONMENTAL AND (B) WHETHER EUROFINS LANCASTER LABORATORIES ENVIRONMENTAL HAS BEEN INFORMED OF THE POSSIBILITY OF SUCH DAMAGES. We accept no legal responsibility for the purposes for which the client uses the test results. No purchase order or other order for work shall be accepted by Eurofins Lancaster Laboratories Environmental which includes any conditions that vary from the Standard Terms and Conditions, and Eurofins Lancaster Laboratories Environmental hereby objects to any conflicting terms contained in any acceptance or order submitted by client.

eurofins | Lancaster Laboratories Environmental

Data Qualifiers

Qualifier	Definition
C	Result confirmed by reanalysis
D1	Indicates for dual column analyses that the result is reported from column 1
D2	Indicates for dual column analyses that the result is reported from column 2
E	Concentration exceeds the calibration range
J (or G, I, X)	Estimated value >= the Method Detection Limit (MDL or DL) and < the Limit of Quantitation (LOQ or RL)
P	Concentration difference between the primary and confirmation column >40%. The lower result is reported.
U	Analyte was not detected at the value indicated
V	Concentration difference between the primary and confirmation column >100%. The reporting limit is raised due to this disparity and evident interference.
W	The dissolved oxygen uptake for the unseeded blank is greater than 0.20 mg/L.
Z	Laboratory Defined - see analysis report

Additional Organic and Inorganic CLP qualifiers may be used with Form 1 reports as defined by the CLP methods.
Qualifiers specific to Dioxin/Furans and PCB Congeners are detailed on the individual Analysis Report.

Project Name: SGPP - Bennington
ELLE Group #: 1870256

General Comments:

See the Laboratory Sample Analysis Record section of the Analysis Report for the method references.

All QC met criteria unless otherwise noted in an Analysis Specific Comment below.
Refer to the QC Summary for specific values and acceptance criteria.

Project specific QC samples are not included in this data set.

Matrix QC may not be reported if site-specific QC samples were not submitted. In these situations, to demonstrate precision and accuracy at a batch level, a LCS/LCSD was performed, unless otherwise specified in the method.

Surrogate recoveries (if applicable) which are outside of the QC window are confirmed unless attributed to a dilution or otherwise noted in an Analysis Specific Comment below.

For dual column analyses, the surrogate (for multi-surrogate tests, at least one surrogate) must be within the acceptance limits on at least one of the two columns.

The samples were received at the appropriate temperature and in accordance with the chain of custody unless otherwise noted.

Analysis Specific Comments:

EPA 537 Version 1.1 Modified, Misc. Organics

Sample #s: 9295924

The stated QC limits are advisory only until sufficient data points can be obtained to calculate statistical limits.

Batch #: 17307011 (Sample number(s): 9295924-9295927 UNSPK: P291199)

The relative percent difference(s) for the following analyte(s) in the MS/MSD were outside acceptance windows: Perfluoro-octanesulfonate

The recovery(ies) for one or more surrogates exceeded the acceptance window indicating a positive bias for sample(s) LCS

The recovery(ies) for one or more surrogates were below the acceptance window for sample(s) 9295924, MS, MSD

Batch #: 17310003 (Sample number(s): 9295922-9295923)

The recovery(ies) for the following analyte(s) in the LCS and/or LCSD exceeded the acceptance window indicating a positive bias: Perfluorotridecanoic acid

The relative percent difference(s) for the following analyte(s) in the LCS/LCSD were outside acceptance windows: Perfluoro-octanesulfonate. When the individual % recovery is within the acceptance limits, the data is reported.

SW-846 6010C, Metals

Batch #: 173101063701 (Sample number(s): 9295924-9295927 UNSPK: P294601 BKG: P294601)

The recovery(ies) for the following analyte(s) in the MS and/or MSD exceeded the acceptance window indicating a positive bias: Aluminum, Magnesium

The recovery(ies) for the following analyte(s) in the MS and/or MSD were below the acceptance window: Iron, Calcium

The duplicate RPD for the following analyte(s) exceeded the acceptance window: Magnesium, Potassium

SW-846 6020A, Metals

Batch #: 173101063701A (Sample number(s): 9295924-9295927 UNSPK: P294601 BKG: P294601)

The recovery(ies) for the following analyte(s) in the MS and/or MSD exceeded the acceptance window indicating a positive bias: Arsenic, Lead

The recovery(ies) for the following analyte(s) in the MS and/or MSD were below the acceptance window: Antimony, Beryllium, Arsenic, Copper, Lead, Nickel

The relative percent difference(s) for the following analyte(s) in the MS/MSD were outside acceptance windows: Arsenic, Beryllium, Copper, Lead, Nickel

The duplicate RPD for the following analyte(s) exceeded the acceptance window: Chromium, Silver

Batch #: 173101063701D (Sample number(s): 9295924-9295927 UNSPK: P294601 BKG: P294601)

The recovery(ies) for the following analyte(s) in the MS and/or MSD exceeded the acceptance window indicating a positive bias: Barium

The recovery(ies) for the following analyte(s) in the MS and/or MSD were below the acceptance window: Barium

The relative percent difference(s) for the following analyte(s) in the MS/MSD were outside acceptance windows: Barium

SM 5310 B modified-2000, Wet Chemistry

Sample #s: 9295924, 9295926, 9295927

Due to the nature of this sample matrix, the sample cup was filled to capacity with less than 1000 mg of sample being used. The lowered sample weight has resulted in a raised reporting limit.

SW-846 9045D modified, Wet Chemistry

Sample #s: 9295926

The pH was measured in water at 19.9 C.

Sample #s: 9295927

The pH was measured in water at 20.2 C.

Sample #s: 9295924

The pH was measured in water at 20.4 C.

Sample #s: 9295925

The pH was measured in water at 20.5 C.

SM 2540 G-1997 %Moisture Calc, Wet Chemistry

Batch #: 17306820012B (Sample number(s): 9295924, 9295926-9295927 BKG: P295925)

The duplicate RPD for the following analyte(s) exceeded the acceptance window: Moisture

Batch #: 17310820004B (Sample number(s): 9295925 BKG: 9295925)

2425 New Holland Pike, Lancaster, PA 17601 • 717-656-2300 • Fax: 717-656-6766 • www.EurofinsUS.com/LancLabsEnv

The duplicate RPD for the following analyte(s) exceeded the acceptance window: Moisture

Quality Control Summary

Client Name: C. T. Male Associates
Reported: 11/15/2017 13:51

Group Number: 1870256

Matrix QC may not be reported if insufficient sample or site-specific QC samples were not submitted. In these situations, to demonstrate precision and accuracy at a batch level, a LCS/LCSD was performed, unless otherwise specified in the method.

All Inorganic Initial Calibration and Continuing Calibration Blanks met acceptable method criteria unless otherwise noted on the Analysis Report.

Explanation of Symbols and Abbreviations

The following defines common symbols and abbreviations used in reporting technical data:

BMQL	Below Minimum Quantitation Level	**mg**	milligram(s)
C	degrees Celsius	**mL**	milliliter(s)
cfu	colony forming units	**MPN**	Most Probable Number
CP Units	cobalt-chloroplatinate units	**N.D.**	non-detect
F	degrees Fahrenheit	**ng**	nanogram(s)
g	gram(s)	**NTU**	nephelometric turbidity units
IU	International Units	**pg/L**	picogram/liter
kg	kilogram(s)	**RL**	Reporting Limit
L	liter(s)	**TNTC**	Too Numerous To Count
lb.	pound(s)	**µg**	microgram(s)
m3	cubic meter(s)	**µL**	microliter(s)
meq	milliequivalents	**umhos/cm**	micromhos/cm

<	less than
>	greater than
ppm	parts per million - One ppm is equivalent to one milligram per kilogram (mg/kg) or one gram per million grams. For aqueous liquids, ppm is usually taken to be equivalent to milligrams per liter (mg/l), because one liter of water has a weight very close to a kilogram. For gases or vapors, one ppm is equivalent to one microliter per liter of gas.
ppb	parts per billion
Dry weight basis	Results printed under this heading have been adjusted for moisture content. This increases the analyte weight concentration to approximate the value present in a similar sample without moisture. All other results are reported on an as-received basis.

Analytical test results meet all requirements of the associated regulatory program (i.e., NELAC (TNI), DoD, and ISO 17025) unless otherwise noted under the individual analysis.

Measurement uncertainty values, as applicable, are available upon request.

Tests results relate only to the sample tested. Clients should be aware that a critical step in a chemical or microbiological analysis is the collection of the sample. Unless the sample analyzed is truly representative of the bulk of material involved, the test results will be meaningless. If you have questions regarding the proper techniques of collecting samples, please contact us. We cannot be held responsible for sample integrity, however, unless sampling has been performed by a member of our staff.

This report shall not be reproduced except in full, without the written approval of the laboratory.

Times are local to the area of activity. Parameters listed in the 40 CFR Part 136 Table II as “analyze immediately” are not performed within 15 minutes.

WARRANTY AND LIMITS OF LIABILITY - In accepting analytical work, we warrant the accuracy of test results for the sample as submitted. THE FOREGOING EXPRESS WARRANTY IS EXCLUSIVE AND IS GIVEN IN LIEU OF ALL OTHER WARRANTIES, EXPRESSED OR IMPLIED. WE DISCLAIM ANY OTHER WARRANTIES, EXPRESSED OR IMPLIED, INCLUDING A WARRANTY OF FITNESS FOR PARTICULAR PURPOSE AND WARRANTY OF MERCHANTABILITY. IN NO EVENT SHALL EUROFINS LANCASTER LABORATORIES ENVIRONMENTAL, LLC BE LIABLE FOR INDIRECT, SPECIAL, CONSEQUENTIAL, OR INCIDENTAL DAMAGES INCLUDING, BUT NOT LIMITED TO, DAMAGES FOR LOSS OF PROFIT OR GOODWILL REGARDLESS OF (A) THE NEGLIGENCE (EITHER SOLE OR CONCURRENT) OF EUROFINS LANCASTER LABORATORIES ENVIRONMENTAL AND (B) WHETHER EUROFINS LANCASTER LABORATORIES ENVIRONMENTAL HAS BEEN INFORMED OF THE POSSIBILITY OF SUCH DAMAGES. We accept no legal responsibility for the purposes for which the client uses the test results. No purchase order or other order for work shall be accepted by Eurofins Lancaster Laboratories Environmental which includes any conditions that vary from the Standard Terms and Conditions, and Eurofins Lancaster Laboratories Environmental hereby objects to any conflicting terms contained in any acceptance or order submitted by client.

eurofins | Lancaster Laboratories Environmental

Data Qualifiers

Qualifier	Definition
C	Result confirmed by reanalysis
D1	Indicates for dual column analyses that the result is reported from column 1
D2	Indicates for dual column analyses that the result is reported from column 2
E	Concentration exceeds the calibration range
J (or G, I, X)	Estimated value >= the Method Detection Limit (MDL or DL) and < the Limit of Quantitation (LOQ or RL)
P	Concentration difference between the primary and confirmation column >40%. The lower result is reported.
U	Analyte was not detected at the value indicated
V	Concentration difference between the primary and confirmation column >100%. The reporting limit is raised due to this disparity and evident interference.
W	The dissolved oxygen uptake for the unseeded blank is greater than 0.20 mg/L.
Z	Laboratory Defined - see analysis report

Additional Organic and Inorganic CLP qualifiers may be used with Form 1 reports as defined by the CLP methods.
Qualifiers specific to Dioxin/Furans and PCB Congeners are detailed on the individual Analysis Report.

General Comments:

See the Laboratory Sample Analysis Record section of the Analysis Report for the method references.

All QC met criteria unless otherwise noted in an Analysis Specific Comment below.
Refer to the QC Summary for specific values and acceptance criteria.

Project specific QC samples are not included in this data set.

Matrix QC may not be reported if site-specific QC samples were not submitted. In these situations, to demonstrate precision and accuracy at a batch level, a LCS/LCSD was performed, unless otherwise specified in the method.

Surrogate recoveries (if applicable) which are outside of the QC window are confirmed unless attributed to a dilution or otherwise noted in an Analysis Specific Comment below.

For dual column analyses, the surrogate (for multi-surrogate tests, at least one surrogate) must be within the acceptance limits on at least one of the two columns.

The samples were received at the appropriate temperature and in accordance with the chain of custody unless otherwise noted.

Analysis Specific Comments:

EPA 537 Version 1.1 Modified, Misc. Organics

Sample #s: 9299619

The stated QC limits are advisory only until sufficient data points can be obtained to calculate statistical limits.

Sample #s: 9299616, 9299617, 9299618

The stated QC limits are advisory only until sufficient data points can be obtained to calculate statistical limits.

The recovery for labeled compound used as extraction standard 13C2-8:2-FTS is outside of QC acceptance limits in the opening and closing calibration standard (CCV).

The recoveries for labeled compound used as extraction standards d3-NMeFOSAA and d5-NEtFOSAA are outside of QC acceptance limits in the closing calibration standard (CCV).

Batch #: 17310004 (Sample number(s): 9299616-9299618)

The recovery(ies) for the following analyte(s) in the LCS and/or LCSD exceeded the acceptance window indicating a positive bias: Perfluorooctanoic acid, NMeFOSAA, Perfluorodecanoic acid

The recovery(ies) for one or more surrogates were below the acceptance window for sample(s) 9299616, 9299617, 9299618, Blank, LCS, LCSD

Batch #: 17311004 (Sample number(s): 9299619 UNSPK: 9299619)

The recovery(ies) for the following analyte(s) in the MS exceeded the acceptance window indicating a positive bias: Perfluorotridecanoic acid

The recovery(ies) for one or more surrogates were below the acceptance window for sample(s) 9299619,

Blank, MS

SW-846 6010C, Metals

Sample #s: 9299619

Reporting limits for metals were raised due to interference from the sample matrix.

Batch #: 173101063701 (Sample number(s): 9299619 UNSPK: P294601 BKG: P294601)

The recovery(ies) for the following analyte(s) in the MS and/or MSD exceeded the acceptance window indicating a positive bias: Aluminum, Magnesium

The recovery(ies) for the following analyte(s) in the MS and/or MSD were below the acceptance window: Iron, Calcium

The duplicate RPD for the following analyte(s) exceeded the acceptance window: Magnesium, Potassium

SW-846 6020A, Metals

Batch #: 173101063701A (Sample number(s): 9299619 UNSPK: P294601 BKG: P294601)

The recovery(ies) for the following analyte(s) in the MS and/or MSD exceeded the acceptance window indicating a positive bias: Arsenic, Lead

The recovery(ies) for the following analyte(s) in the MS and/or MSD were below the acceptance window: Antimony, Beryllium, Arsenic, Copper, Lead, Nickel

The relative percent difference(s) for the following analyte(s) in the MS/MSD were outside acceptance windows: Arsenic, Beryllium, Copper, Lead, Nickel

The duplicate RPD for the following analyte(s) exceeded the acceptance window: Chromium, Silver

Batch #: 173101063701D (Sample number(s): 9299619 UNSPK: P294601 BKG: P294601)

The recovery(ies) for the following analyte(s) in the MS and/or MSD exceeded the acceptance window indicating a positive bias: Barium

The recovery(ies) for the following analyte(s) in the MS and/or MSD were below the acceptance window: Barium

The relative percent difference(s) for the following analyte(s) in the MS/MSD were outside acceptance windows: Barium

SM 5310 B modified-2000, Wet Chemistry

Sample #s: 9299619

Due to the nature of this sample matrix, the sample cup was filled to capacity with less than 1000 mg of sample being used. The lowered sample weight has resulted in a raised reporting limit.

SW-846 9045D modified, Wet Chemistry

Sample #s: 9299619

The pH was measured in water at 20.2 C.

SM 2540 G-1997 %Moisture Calc, Wet Chemistry

Batch #: 17311820006B (Sample number(s): 9299619 BKG: P299297)

The duplicate RPD for the following analyte(s) exceeded the acceptance window: Moisture

The stated QC limits are advisory only until sufficient data points can be obtained to calculate statistical limits.

The recovery for labeled compound used as extraction standard 13C2-8:2-FTS is outside of QC acceptance limits in the opening and closing calibration standard (CCV).

The recoveries for labeled compound used as extraction standards d3-NMeFOSAA and d5-NEtFOSAA are outside of QC acceptance limits in the closing calibration standard (CCV).

Sample Comments

All QC is compliant unless otherwise noted. Please refer to the Quality Control Summary for overall QC performance data and associated samples.

Quality Control Summary

Client Name: C. T. Male Associates
Reported: 11/15/2017 14:04

Group Number: 1871096

Matrix QC may not be reported if insufficient sample or site-specific QC samples were not submitted. In these situations, to demonstrate precision and accuracy at a batch level, a LCS/LCSD was performed, unless otherwise specified in the method.

All Inorganic Initial Calibration and Continuing Calibration Blanks met acceptable method criteria unless otherwise noted on the Analysis Report.

Surrogate Quality Control

Surrogate recoveries which are outside of the QC window are confirmed unless attributed to dilution or otherwise noted on the Analysis Report. For dual column analyses, the surrogate (at least one surrogate for multi-surrogate tests) must be within the acceptance limits on at least one of the two columns.

Explanation of Symbols and Abbreviations

The following defines common symbols and abbreviations used in reporting technical data:

BMQL	Below Minimum Quantitation Level	**mg**	milligram(s)
C	degrees Celsius	**mL**	milliliter(s)
cfu	colony forming units	**MPN**	Most Probable Number
CP Units	cobalt-chloroplatinate units	**N.D.**	non-detect
F	degrees Fahrenheit	**ng**	nanogram(s)
g	gram(s)	**NTU**	nephelometric turbidity units
IU	International Units	**pg/L**	picogram/liter
kg	kilogram(s)	**RL**	Reporting Limit
L	liter(s)	**TNTC**	Too Numerous To Count
lb.	pound(s)	**µg**	microgram(s)
m3	cubic meter(s)	**µL**	microliter(s)
meq	milliequivalents	**umhos/cm**	micromhos/cm

<	less than
>	greater than
ppm	parts per million - One ppm is equivalent to one milligram per kilogram (mg/kg) or one gram per million grams. For aqueous liquids, ppm is usually taken to be equivalent to milligrams per liter (mg/l), because one liter of water has a weight very close to a kilogram. For gases or vapors, one ppm is equivalent to one microliter per liter of gas.
ppb	parts per billion
Dry weight basis	Results printed under this heading have been adjusted for moisture content. This increases the analyte weight concentration to approximate the value present in a similar sample without moisture. All other results are reported on an as-received basis.

Analytical test results meet all requirements of the associated regulatory program (i.e., NELAC (TNI), DoD, and ISO 17025) unless otherwise noted under the individual analysis.

Measurement uncertainty values, as applicable, are available upon request.

Tests results relate only to the sample tested. Clients should be aware that a critical step in a chemical or microbiological analysis is the collection of the sample. Unless the sample analyzed is truly representative of the bulk of material involved, the test results will be meaningless. If you have questions regarding the proper techniques of collecting samples, please contact us. We cannot be held responsible for sample integrity, however, unless sampling has been performed by a member of our staff.

This report shall not be reproduced except in full, without the written approval of the laboratory.

Times are local to the area of activity. Parameters listed in the 40 CFR Part 136 Table II as “analyze immediately” are not performed within 15 minutes.

WARRANTY AND LIMITS OF LIABILITY - In accepting analytical work, we warrant the accuracy of test results for the sample as submitted. THE FOREGOING EXPRESS WARRANTY IS EXCLUSIVE AND IS GIVEN IN LIEU OF ALL OTHER WARRANTIES, EXPRESSED OR IMPLIED. WE DISCLAIM ANY OTHER WARRANTIES, EXPRESSED OR IMPLIED, INCLUDING A WARRANTY OF FITNESS FOR PARTICULAR PURPOSE AND WARRANTY OF MERCHANTABILITY. IN NO EVENT SHALL EUROFINS LANCASTER LABORATORIES ENVIRONMENTAL, LLC BE LIABLE FOR INDIRECT, SPECIAL, CONSEQUENTIAL, OR INCIDENTAL DAMAGES INCLUDING, BUT NOT LIMITED TO, DAMAGES FOR LOSS OF PROFIT OR GOODWILL REGARDLESS OF (A) THE NEGLIGENCE (EITHER SOLE OR CONCURRENT) OF EUROFINS LANCASTER LABORATORIES ENVIRONMENTAL AND (B) WHETHER EUROFINS LANCASTER LABORATORIES ENVIRONMENTAL HAS BEEN INFORMED OF THE POSSIBILITY OF SUCH DAMAGES. We accept no legal responsibility for the purposes for which the client uses the test results. No purchase order or other order for work shall be accepted by Eurofins Lancaster Laboratories Environmental which includes any conditions that vary from the Standard Terms and Conditions, and Eurofins Lancaster Laboratories Environmental hereby objects to any conflicting terms contained in any acceptance or order submitted by client.

eurofins | Lancaster Laboratories Environmental

Data Qualifiers

Qualifier	Definition
C	Result confirmed by reanalysis
D1	Indicates for dual column analyses that the result is reported from column 1
D2	Indicates for dual column analyses that the result is reported from column 2
E	Concentration exceeds the calibration range
J (or G, I, X)	Estimated value >= the Method Detection Limit (MDL or DL) and < the Limit of Quantitation (LOQ or RL)
P	Concentration difference between the primary and confirmation column >40%. The lower result is reported.
U	Analyte was not detected at the value indicated
V	Concentration difference between the primary and confirmation column >100%. The reporting limit is raised due to this disparity and evident interference.
W	The dissolved oxygen uptake for the unseeded blank is greater than 0.20 mg/L.
Z	Laboratory Defined - see analysis report

Additional Organic and Inorganic CLP qualifiers may be used with Form 1 reports as defined by the CLP methods.
Qualifiers specific to Dioxin/Furans and PCB Congeners are detailed on the individual Analysis Report.

SAMPLE INFORMATION

Client Sample Description	Sample Collection Date/Time	ELLE#
SG3-FILTEREDWATERTKB-171103 Water	11/03/2017 09:50	9300638

The specific methodologies used in obtaining the enclosed analytical results are indicated on the Laboratory Sample Analysis Record.

2425 New Holland Pike, Lancaster, PA 17601 • 717-656-2300 • Fax: 717-656-6766 • www.EurofinsUS.com/LancLabsEnv

Project Name: SGPP - Bennington
ELLE Group #: 1871339

General Comments:

See the Laboratory Sample Analysis Record section of the Analysis Report for the method references.

All QC met criteria unless otherwise noted in an Analysis Specific Comment below.

Refer to the QC Summary for specific values and acceptance criteria.

Project specific QC samples are not included in this data set.

Matrix QC may not be reported if site-specific QC samples were not submitted. In these situations, to demonstrate precision and accuracy at a batch level, a LCS/LCSD was performed, unless otherwise specified in the method.

Surrogate recoveries (if applicable) which are outside of the QC window are confirmed unless attributed to a dilution or otherwise noted in an Analysis Specific Comment below.

For dual column analyses, the surrogate (for multi-surrogate tests, at least one surrogate) must be within the acceptance limits on at least one of the two columns.

The samples were received at the appropriate temperature and in accordance with the chain of custody unless otherwise noted.

Analysis Specific Comments:

EPA 537 Version 1.1 Modified, Misc. Organics

Sample #s: 9300638

The stated QC limits are advisory only until sufficient data points can be obtained to calculate statistical limits.

Batch #: 17308005 (Sample number(s): 9300638)

The recovery(ies) for one or more surrogates were below the acceptance window for sample(s) 9300638, Blank, LCS, LCSD

Quality Control Summary

Client Name: C. T. Male Associates
Reported: 11/06/2017 10:55

Group Number: 1871339

Matrix QC may not be reported if insufficient sample or site-specific QC samples were not submitted. In these situations, to demonstrate precision and accuracy at a batch level, a LCS/LCSD was performed, unless otherwise specified in the method.

All Inorganic Initial Calibration and Continuing Calibration Blanks met acceptable method criteria unless otherwise noted on the Analysis Report.

Method Blank

Analysis Name	Result ng/l	MDL** ng/l	LOQ ng/l
Batch number: 17308005	Sample number(s): 9300638

Explanation of Symbols and Abbreviations

The following defines common symbols and abbreviations used in reporting technical data:

BMQL	Below Minimum Quantitation Level	**mg**	milligram(s)
C	degrees Celsius	**mL**	milliliter(s)
cfu	colony forming units	**MPN**	Most Probable Number
CP Units	cobalt-chloroplatinate units	**N.D.**	non-detect
F	degrees Fahrenheit	**ng**	nanogram(s)
g	gram(s)	**NTU**	nephelometric turbidity units
IU	International Units	**pg/L**	picogram/liter
kg	kilogram(s)	**RL**	Reporting Limit
L	liter(s)	**TNTC**	Too Numerous To Count
lb.	pound(s)	**µg**	microgram(s)
m3	cubic meter(s)	**µL**	microliter(s)
meq	milliequivalents	**umhos/cm**	micromhos/cm

<	less than
>	greater than
ppm	parts per million - One ppm is equivalent to one milligram per kilogram (mg/kg) or one gram per million grams. For aqueous liquids, ppm is usually taken to be equivalent to milligrams per liter (mg/l), because one liter of water has a weight very close to a kilogram. For gases or vapors, one ppm is equivalent to one microliter per liter of gas.
ppb	parts per billion
Dry weight basis	Results printed under this heading have been adjusted for moisture content. This increases the analyte weight concentration to approximate the value present in a similar sample without moisture. All other results are reported on an as-received basis.

Analytical test results meet all requirements of the associated regulatory program (i.e., NELAC (TNI), DoD, and ISO 17025) unless otherwise noted under the individual analysis.

Measurement uncertainty values, as applicable, are available upon request.

Tests results relate only to the sample tested. Clients should be aware that a critical step in a chemical or microbiological analysis is the collection of the sample. Unless the sample analyzed is truly representative of the bulk of material involved, the test results will be meaningless. If you have questions regarding the proper techniques of collecting samples, please contact us. We cannot be held responsible for sample integrity, however, unless sampling has been performed by a member of our staff.

This report shall not be reproduced except in full, without the written approval of the laboratory.

Times are local to the area of activity. Parameters listed in the 40 CFR Part 136 Table II as “analyze immediately” are not performed within 15 minutes.

WARRANTY AND LIMITS OF LIABILITY - In accepting analytical work, we warrant the accuracy of test results for the sample as submitted. THE FOREGOING EXPRESS WARRANTY IS EXCLUSIVE AND IS GIVEN IN LIEU OF ALL OTHER WARRANTIES, EXPRESSED OR IMPLIED. WE DISCLAIM ANY OTHER WARRANTIES, EXPRESSED OR IMPLIED, INCLUDING A WARRANTY OF FITNESS FOR PARTICULAR PURPOSE AND WARRANTY OF MERCHANTABILITY. IN NO EVENT SHALL EUROFINS LANCASTER LABORATORIES ENVIRONMENTAL, LLC BE LIABLE FOR INDIRECT, SPECIAL, CONSEQUENTIAL, OR INCIDENTAL DAMAGES INCLUDING, BUT NOT LIMITED TO, DAMAGES FOR LOSS OF PROFIT OR GOODWILL REGARDLESS OF (A) THE NEGLIGENCE (EITHER SOLE OR CONCURRENT) OF EUROFINS LANCASTER LABORATORIES ENVIRONMENTAL AND (B) WHETHER EUROFINS LANCASTER LABORATORIES ENVIRONMENTAL HAS BEEN INFORMED OF THE POSSIBILITY OF SUCH DAMAGES. We accept no legal responsibility for the purposes for which the client uses the test results. No purchase order or other order for work shall be accepted by Eurofins Lancaster Laboratories Environmental which includes any conditions that vary from the Standard Terms and Conditions, and Eurofins Lancaster Laboratories Environmental hereby objects to any conflicting terms contained in any acceptance or order submitted by client.

eurofins | Lancaster Laboratories Environmental

Data Qualifiers

Qualifier	Definition
C	Result confirmed by reanalysis
D1	Indicates for dual column analyses that the result is reported from column 1
D2	Indicates for dual column analyses that the result is reported from column 2
E	Concentration exceeds the calibration range
J (or G, I, X)	Estimated value >= the Method Detection Limit (MDL or DL) and < the Limit of Quantitation (LOQ or RL)
P	Concentration difference between the primary and confirmation column >40%. The lower result is reported.
U	Analyte was not detected at the value indicated
V	Concentration difference between the primary and confirmation column >100%. The reporting limit is raised due to this disparity and evident interference.
W	The dissolved oxygen uptake for the unseeded blank is greater than 0.20 mg/L.
Z	Laboratory Defined - see analysis report

Additional Organic and Inorganic CLP qualifiers may be used with Form 1 reports as defined by the CLP methods.
Qualifiers specific to Dioxin/Furans and PCB Congeners are detailed on the individual Analysis Report.

General Comments:

See the Laboratory Sample Analysis Record section of the Analysis Report for the method references.

All QC met criteria unless otherwise noted in an Analysis Specific Comment below.
Refer to the QC Summary for specific values and acceptance criteria.

Project specific QC samples are not included in this data set.

Matrix QC may not be reported if site-specific QC samples were not submitted. In these situations, to demonstrate precision and accuracy at a batch level, a LCS/LCSD was performed, unless otherwise specified in the method.

Surrogate recoveries (if applicable) which are outside of the QC window are confirmed unless attributed to a dilution or otherwise noted in an Analysis Specific Comment below.

For dual column analyses, the surrogate (for multi-surrogate tests, at least one surrogate) must be within the acceptance limits on at least one of the two columns.

The samples were received at the appropriate temperature and in accordance with the chain of custody unless otherwise noted.

Analysis Specific Comments:

EPA 537 Version 1.1 Modified, Misc. Organics

Sample #s: 9300645

The stated QC limits are advisory only until sufficient data points can be obtained to calculate statistical limits.

The recoveries for labeled compound used as extraction standards 13C2-8:2-FTS, d3-NMeFOSAA and d5-NEtFOSAA are outside of QC acceptance limits in the opening calibration standard (CCV).

Sample #s: 9300642, 9300643, 9300644

The stated QC limits are advisory only until sufficient data points can be obtained to calculate statistical limits.

The recovery for labeled compound used as extraction standard 13C2-8:2-FTS is outside of QC acceptance limits in the opening and closing calibration standard (CCV).

The recoveries for labeled compound used as extraction standards d3-NMeFOSAA and d5-NEtFOSAA are outside of QC acceptance limits in the closing calibration standard (CCV).

Batch #: 17310004 (Sample number(s): 9300642-9300645)

The recovery(ies) for the following analyte(s) in the LCS and/or LCSD exceeded the acceptance window indicating a positive bias: Perfluorooctanoic acid, NMeFOSAA, Perfluorodecanoic acid

The recovery(ies) for one or more surrogates were below the acceptance window for sample(s) 9300642, 9300643, 9300644, 9300645, Blank, LCS, LCSD

The stated QC limits are advisory only until sufficient data points can be obtained to calculate statistical limits.

The recovery for labeled compound used as extraction standard 13C2-8:2-FTS is outside of QC acceptance limits in the opening and closing calibration standard (CCV).

The recoveries for labeled compound used as extraction standards d3-NMeFOSAA and d5-NEtFOSAA are outside of QC acceptance limits in the closing calibration standard (CCV).

Sample Comments

All QC is compliant unless otherwise noted. Please refer to the Quality Control Summary for overall QC performance data and associated samples.

Quality Control Summary

Client Name: C. T. Male Associates
Reported: 11/14/2017 15:23

Group Number: 1871343

Matrix QC may not be reported if insufficient sample or site-specific QC samples were not submitted. In these situations, to demonstrate precision and accuracy at a batch level, a LCS/LCSD was performed, unless otherwise specified in the method.

All Inorganic Initial Calibration and Continuing Calibration Blanks met acceptable method criteria unless otherwise noted on the Analysis Report.

Sample Administration Receipt Documentation Log

Doc Log ID: 200027

Group Number(s): 1871343

Client: BARR Engineering

Delivery and Receipt Information

Delivery Method:	Fed Ex	Arrival Timestamp:	11/04/2017 10:00
Number of Packages:	1	Number of Projects:	1
State/Province of Origin:	VT		

Arrival Condition Summary

Shipping Container Sealed:	Yes	Sample IDs on COC match Containers:	Yes
Custody Seal Present:	No	Sample Date/Times match COC:	Yes
Samples Chilled:	Yes	VOA Vial Headspace ≥ 6mm:	N/A
Paperwork Enclosed:	Yes	Total Trip Blank Qty:	2
Samples Intact:	Yes	Trip Blank Type:	See Below
Missing Samples:	No	Air Quality Samples Present:	No
Extra Samples:	No		
Discrepancy in Container Qty on COC:	No		

Trip Blank Type(s): 2-250 mL plastic bottles (Trizma)

Unpacked by Melvin Sanchez (8943) at 11:08 on 11/04/2017

Samples Chilled Details

Thermometer Types: DT = Digital (Temp. Bottle) IR = Infrared (Surface Temp) All Temperatures in °C.

Cooler #	Thermometer ID	Corrected Temp	Therm. Type	Ice Type	Ice Present?	Ice Container	Elevated Temp?

Explanation of Symbols and Abbreviations

The following defines common symbols and abbreviations used in reporting technical data:

BMQL	Below Minimum Quantitation Level	**mg**	milligram(s)
C	degrees Celsius	**mL**	milliliter(s)
cfu	colony forming units	**MPN**	Most Probable Number
CP Units	cobalt-chloroplatinate units	**N.D.**	non-detect
F	degrees Fahrenheit	**ng**	nanogram(s)
g	gram(s)	**NTU**	nephelometric turbidity units
IU	International Units	**pg/L**	picogram/liter
kg	kilogram(s)	**RL**	Reporting Limit
L	liter(s)	**TNTC**	Too Numerous To Count
lb.	pound(s)	**µg**	microgram(s)
m3	cubic meter(s)	**µL**	microliter(s)
meq	milliequivalents	**umhos/cm**	micromhos/cm

<	less than
>	greater than
ppm	parts per million - One ppm is equivalent to one milligram per kilogram (mg/kg) or one gram per million grams. For aqueous liquids, ppm is usually taken to be equivalent to milligrams per liter (mg/l), because one liter of water has a weight very close to a kilogram. For gases or vapors, one ppm is equivalent to one microliter per liter of gas.
ppb	parts per billion
Dry weight basis	Results printed under this heading have been adjusted for moisture content. This increases the analyte weight concentration to approximate the value present in a similar sample without moisture. All other results are reported on an as-received basis.

Analytical test results meet all requirements of the associated regulatory program (i.e., NELAC (TNI), DoD, and ISO 17025) unless otherwise noted under the individual analysis.

Measurement uncertainty values, as applicable, are available upon request.

Tests results relate only to the sample tested. Clients should be aware that a critical step in a chemical or microbiological analysis is the collection of the sample. Unless the sample analyzed is truly representative of the bulk of material involved, the test results will be meaningless. If you have questions regarding the proper techniques of collecting samples, please contact us. We cannot be held responsible for sample integrity, however, unless sampling has been performed by a member of our staff.

This report shall not be reproduced except in full, without the written approval of the laboratory.

Times are local to the area of activity. Parameters listed in the 40 CFR Part 136 Table II as “analyze immediately” are not performed within 15 minutes.

WARRANTY AND LIMITS OF LIABILITY - In accepting analytical work, we warrant the accuracy of test results for the sample as submitted. THE FOREGOING EXPRESS WARRANTY IS EXCLUSIVE AND IS GIVEN IN LIEU OF ALL OTHER WARRANTIES, EXPRESSED OR IMPLIED. WE DISCLAIM ANY OTHER WARRANTIES, EXPRESSED OR IMPLIED, INCLUDING A WARRANTY OF FITNESS FOR PARTICULAR PURPOSE AND WARRANTY OF MERCHANTABILITY. IN NO EVENT SHALL EUROFINS LANCASTER LABORATORIES ENVIRONMENTAL, LLC BE LIABLE FOR INDIRECT, SPECIAL, CONSEQUENTIAL, OR INCIDENTAL DAMAGES INCLUDING, BUT NOT LIMITED TO, DAMAGES FOR LOSS OF PROFIT OR GOODWILL REGARDLESS OF (A) THE NEGLIGENCE (EITHER SOLE OR CONCURRENT) OF EUROFINS LANCASTER LABORATORIES ENVIRONMENTAL AND (B) WHETHER EUROFINS LANCASTER LABORATORIES ENVIRONMENTAL HAS BEEN INFORMED OF THE POSSIBILITY OF SUCH DAMAGES. We accept no legal responsibility for the purposes for which the client uses the test results. No purchase order or other order for work shall be accepted by Eurofins Lancaster Laboratories Environmental which includes any conditions that vary from the Standard Terms and Conditions, and Eurofins Lancaster Laboratories Environmental hereby objects to any conflicting terms contained in any acceptance or order submitted by client.

eurofins | Lancaster Laboratories Environmental

Data Qualifiers

Qualifier	Definition
C	Result confirmed by reanalysis
D1	Indicates for dual column analyses that the result is reported from column 1
D2	Indicates for dual column analyses that the result is reported from column 2
E	Concentration exceeds the calibration range
J (or G, I, X)	Estimated value >= the Method Detection Limit (MDL or DL) and < the Limit of Quantitation (LOQ or RL)
P	Concentration difference between the primary and confirmation column >40%. The lower result is reported.
U	Analyte was not detected at the value indicated
V	Concentration difference between the primary and confirmation column >100%. The reporting limit is raised due to this disparity and evident interference.
W	The dissolved oxygen uptake for the unseeded blank is greater than 0.20 mg/L.
Z	Laboratory Defined - see analysis report

Additional Organic and Inorganic CLP qualifiers may be used with Form 1 reports as defined by the CLP methods.
Qualifiers specific to Dioxin/Furans and PCB Congeners are detailed on the individual Analysis Report.

ELLE Group #: 1871378

General Comments:

See the Laboratory Sample Analysis Record section of the Analysis Report for the method references.

All QC met criteria unless otherwise noted in an Analysis Specific Comment below.

Refer to the QC Summary for specific values and acceptance criteria.

Project specific QC samples are not included in this data set.

Matrix QC may not be reported if site-specific QC samples were not submitted. In these situations, to demonstrate precision and accuracy at a batch level, a LCS/LCSD was performed, unless otherwise specified in the method.

Surrogate recoveries (if applicable) which are outside of the QC window are confirmed unless attributed to a dilution or otherwise noted in an Analysis Specific Comment below.

For dual column analyses, the surrogate (for multi-surrogate tests, at least one surrogate) must be within the acceptance limits on at least one of the two columns.

The samples were received at the appropriate temperature and in accordance with the chain of custody unless otherwise noted.

Analysis Specific Comments:

No additional comments are necessary.

Quality Control Summary

Client Name: C. T. Male Associates
Group Number: 1871378
Reported: 12/11/2017 12:02

Matrix QC may not be reported if insufficient sample or site-specific QC samples were not submitted. In these situations, to demonstrate precision and accuracy at a batch level, a LCS/LCSD was performed, unless otherwise specified in the method.

All Inorganic Initial Calibration and Continuing Calibration Blanks met acceptable method criteria unless otherwise noted on the Analysis Report.

*- Outside of specification
**-This limit was used in the evaluation of the final result for the blank
(1) The result for one or both determinations was less than five times the LOQ.
(2) The unspiked result was more than four times the spike added.
P###### is indicative of a Background or Unspiked sample that is batch matrix QC and was not performed using a sample from this submission group.

Explanation of Symbols and Abbreviations

The following defines common symbols and abbreviations used in reporting technical data:

BMQL	Below Minimum Quantitation Level	**mg**	milligram(s)
C	degrees Celsius	**mL**	milliliter(s)
cfu	colony forming units	**MPN**	Most Probable Number
CP Units	cobalt-chloroplatinate units	**N.D.**	non-detect
F	degrees Fahrenheit	**ng**	nanogram(s)
g	gram(s)	**NTU**	nephelometric turbidity units
IU	International Units	**pg/L**	picogram/liter
kg	kilogram(s)	**RL**	Reporting Limit
L	liter(s)	**TNTC**	Too Numerous To Count
lb.	pound(s)	**µg**	microgram(s)
m3	cubic meter(s)	**µL**	microliter(s)
meq	milliequivalents	**umhos/cm**	micromhos/cm

<	less than
>	greater than
ppm	parts per million - One ppm is equivalent to one milligram per kilogram (mg/kg) or one gram per million grams. For aqueous liquids, ppm is usually taken to be equivalent to milligrams per liter (mg/l), because one liter of water has a weight very close to a kilogram. For gases or vapors, one ppm is equivalent to one microliter per liter of gas.
ppb	parts per billion
Dry weight basis	Results printed under this heading have been adjusted for moisture content. This increases the analyte weight concentration to approximate the value present in a similar sample without moisture. All other results are reported on an as-received basis.

Analytical test results meet all requirements of the associated regulatory program (i.e., NELAC (TNI), DoD, and ISO 17025) unless otherwise noted under the individual analysis.

Measurement uncertainty values, as applicable, are available upon request.

Tests results relate only to the sample tested. Clients should be aware that a critical step in a chemical or microbiological analysis is the collection of the sample. Unless the sample analyzed is truly representative of the bulk of material involved, the test results will be meaningless. If you have questions regarding the proper techniques of collecting samples, please contact us. We cannot be held responsible for sample integrity, however, unless sampling has been performed by a member of our staff.

This report shall not be reproduced except in full, without the written approval of the laboratory.

Times are local to the area of activity. Parameters listed in the 40 CFR Part 136 Table II as “analyze immediately” are not performed within 15 minutes.

WARRANTY AND LIMITS OF LIABILITY - In accepting analytical work, we warrant the accuracy of test results for the sample as submitted. THE FOREGOING EXPRESS WARRANTY IS EXCLUSIVE AND IS GIVEN IN LIEU OF ALL OTHER WARRANTIES, EXPRESSED OR IMPLIED. WE DISCLAIM ANY OTHER WARRANTIES, EXPRESSED OR IMPLIED, INCLUDING A WARRANTY OF FITNESS FOR PARTICULAR PURPOSE AND WARRANTY OF MERCHANTABILITY. IN NO EVENT SHALL EUROFINS LANCASTER LABORATORIES ENVIRONMENTAL, LLC BE LIABLE FOR INDIRECT, SPECIAL, CONSEQUENTIAL, OR INCIDENTAL DAMAGES INCLUDING, BUT NOT LIMITED TO, DAMAGES FOR LOSS OF PROFIT OR GOODWILL REGARDLESS OF (A) THE NEGLIGENCE (EITHER SOLE OR CONCURRENT) OF EUROFINS LANCASTER LABORATORIES ENVIRONMENTAL AND (B) WHETHER EUROFINS LANCASTER LABORATORIES ENVIRONMENTAL HAS BEEN INFORMED OF THE POSSIBILITY OF SUCH DAMAGES. We accept no legal responsibility for the purposes for which the client uses the test results. No purchase order or other order for work shall be accepted by Eurofins Lancaster Laboratories Environmental which includes any conditions that vary from the Standard Terms and Conditions, and Eurofins Lancaster Laboratories Environmental hereby objects to any conflicting terms contained in any acceptance or order submitted by client.

Data Qualifiers

Qualifier	Definition
C	Result confirmed by reanalysis
D1	Indicates for dual column analyses that the result is reported from column 1
D2	Indicates for dual column analyses that the result is reported from column 2
E	Concentration exceeds the calibration range
J (or G, I, X)	Estimated value >= the Method Detection Limit (MDL or DL) and < the Limit of Quantitation (LOQ or RL)
P	Concentration difference between the primary and confirmation column >40%. The lower result is reported.
U	Analyte was not detected at the value indicated
V	Concentration difference between the primary and confirmation column >100%. The reporting limit is raised due to this disparity and evident interference.
W	The dissolved oxygen uptake for the unseeded blank is greater than 0.20 mg/L.
Z	Laboratory Defined - see analysis report

Additional Organic and Inorganic CLP qualifiers may be used with Form 1 reports as defined by the CLP methods.
Qualifiers specific to Dioxin/Furans and PCB Congeners are detailed on the individual Analysis Report.

General Comments:

See the Laboratory Sample Analysis Record section of the Analysis Report for the method references.

All QC met criteria unless otherwise noted in an Analysis Specific Comment below.

Refer to the QC Summary for specific values and acceptance criteria.

Project specific QC samples are not included in this data set.

Matrix QC may not be reported if site-specific QC samples were not submitted. In these situations, to demonstrate precision and accuracy at a batch level, a LCS/LCSD was performed, unless otherwise specified in the method.

Surrogate recoveries (if applicable) which are outside of the QC window are confirmed unless attributed to a dilution or otherwise noted in an Analysis Specific Comment below.

For dual column analyses, the surrogate (for multi-surrogate tests, at least one surrogate) must be within the acceptance limits on at least one of the two columns.

The samples were received at the appropriate temperature and in accordance with the chain of custody unless otherwise noted.

Analysis Specific Comments:

EPA 537 Version 1.1 Modified, Misc. Organics

Sample #s: 9305656

The response for 6:2-FTS in the initial calibration does not meet the method acceptance limits for the linearity of the calibration curve. Since the analyte is not detected in the associated samples, the data is reported.

The stated QC limits are advisory only until sufficient data points can be obtained to calculate statistical limits.

The recovery for labeled compound used as extraction standard 13C2-PFTeDA is outside of QC acceptance limits in the LCS/LCSD and sample as noted on the QC Summary. The client was contacted and the data reported.

Batch #: 17312010 (Sample number(s): 9305656)

The recovery(ies) for the following analyte(s) in the LCS and/or LCSD were below the acceptance window:
Perfluorotridecanoic acid

The recovery(ies) for one or more surrogates were below the acceptance window for sample(s) 9305656, Blank, LCS, LCSD

Quality Control Summary

Client Name: C. T. Male Associates
Reported: 11/09/2017 09:38

Group Number: 1872652

Matrix QC may not be reported if insufficient sample or site-specific QC samples were not submitted. In these situations, to demonstrate precision and accuracy at a batch level, a LCS/LCSD was performed, unless otherwise specified in the method.

All Inorganic Initial Calibration and Continuing Calibration Blanks met acceptable method criteria unless otherwise noted on the Analysis Report.

Surrogate Quality Control (continued)

Surrogate recoveries which are outside of the QC window are confirmed unless attributed to dilution or otherwise noted on the Analysis Report. For dual column analyses, the surrogate (at least one surrogate for multi-surrogate tests) must be within the acceptance limits on at least one of the two columns.

Analysis Name: 19 PFAS Compounds
Batch number: 17312010

Limits:	17-120	30-128	21-135	28-127	26-119	70-130

*- Outside of specification
**-This limit was used in the evaluation of the final result for the blank
(1) The result for one or both determinations was less than five times the LOQ.
(2) The unspiked result was more than four times the spike added.
P###### is indicative of a Background or Unspiked sample that is batch matrix QC and was not performed using a sample from this submission group.

Explanation of Symbols and Abbreviations

The following defines common symbols and abbreviations used in reporting technical data:

BMQL	Below Minimum Quantitation Level	**mg**	milligram(s)
C	degrees Celsius	**mL**	milliliter(s)
cfu	colony forming units	**MPN**	Most Probable Number
CP Units	cobalt-chloroplatinate units	**N.D.**	non-detect
F	degrees Fahrenheit	**ng**	nanogram(s)
g	gram(s)	**NTU**	nephelometric turbidity units
IU	International Units	**pg/L**	picogram/liter
kg	kilogram(s)	**RL**	Reporting Limit
L	liter(s)	**TNTC**	Too Numerous To Count
lb.	pound(s)	**µg**	microgram(s)
m3	cubic meter(s)	**µL**	microliter(s)
meq	milliequivalents	**umhos/cm**	micromhos/cm

<	less than
>	greater than
ppm	parts per million - One ppm is equivalent to one milligram per kilogram (mg/kg) or one gram per million grams. For aqueous liquids, ppm is usually taken to be equivalent to milligrams per liter (mg/l), because one liter of water has a weight very close to a kilogram. For gases or vapors, one ppm is equivalent to one microliter per liter of gas.
ppb	parts per billion
Dry weight basis	Results printed under this heading have been adjusted for moisture content. This increases the analyte weight concentration to approximate the value present in a similar sample without moisture. All other results are reported on an as-received basis.

Analytical test results meet all requirements of the associated regulatory program (i.e., NELAC (TNI), DoD, and ISO 17025) unless otherwise noted under the individual analysis.

Measurement uncertainty values, as applicable, are available upon request.

Tests results relate only to the sample tested. Clients should be aware that a critical step in a chemical or microbiological analysis is the collection of the sample. Unless the sample analyzed is truly representative of the bulk of material involved, the test results will be meaningless. If you have questions regarding the proper techniques of collecting samples, please contact us. We cannot be held responsible for sample integrity, however, unless sampling has been performed by a member of our staff.

This report shall not be reproduced except in full, without the written approval of the laboratory.

Times are local to the area of activity. Parameters listed in the 40 CFR Part 136 Table II as “analyze immediately” are not performed within 15 minutes.

WARRANTY AND LIMITS OF LIABILITY - In accepting analytical work, we warrant the accuracy of test results for the sample as submitted. THE FOREGOING EXPRESS WARRANTY IS EXCLUSIVE AND IS GIVEN IN LIEU OF ALL OTHER WARRANTIES, EXPRESSED OR IMPLIED. WE DISCLAIM ANY OTHER WARRANTIES, EXPRESSED OR IMPLIED, INCLUDING A WARRANTY OF FITNESS FOR PARTICULAR PURPOSE AND WARRANTY OF MERCHANTABILITY. IN NO EVENT SHALL EUROFINS LANCASTER LABORATORIES ENVIRONMENTAL, LLC BE LIABLE FOR INDIRECT, SPECIAL, CONSEQUENTIAL, OR INCIDENTAL DAMAGES INCLUDING, BUT NOT LIMITED TO, DAMAGES FOR LOSS OF PROFIT OR GOODWILL REGARDLESS OF (A) THE NEGLIGENCE (EITHER SOLE OR CONCURRENT) OF EUROFINS LANCASTER LABORATORIES ENVIRONMENTAL AND (B) WHETHER EUROFINS LANCASTER LABORATORIES ENVIRONMENTAL HAS BEEN INFORMED OF THE POSSIBILITY OF SUCH DAMAGES. We accept no legal responsibility for the purposes for which the client uses the test results. No purchase order or other order for work shall be accepted by Eurofins Lancaster Laboratories Environmental which includes any conditions that vary from the Standard Terms and Conditions, and Eurofins Lancaster Laboratories Environmental hereby objects to any conflicting terms contained in any acceptance or order submitted by client.

eurofins | Lancaster Laboratories Environmental

Data Qualifiers

Qualifier	Definition
C	Result confirmed by reanalysis
D1	Indicates for dual column analyses that the result is reported from column 1
D2	Indicates for dual column analyses that the result is reported from column 2
E	Concentration exceeds the calibration range
J (or G, I, X)	Estimated value >= the Method Detection Limit (MDL or DL) and < the Limit of Quantitation (LOQ or RL)
P	Concentration difference between the primary and confirmation column >40%. The lower result is reported.
U	Analyte was not detected at the value indicated
V	Concentration difference between the primary and confirmation column >100%. The reporting limit is raised due to this disparity and evident interference.
W	The dissolved oxygen uptake for the unseeded blank is greater than 0.20 mg/L.
Z	Laboratory Defined - see analysis report

Additional Organic and Inorganic CLP qualifiers may be used with Form 1 reports as defined by the CLP methods.
Qualifiers specific to Dioxin/Furans and PCB Congeners are detailed on the individual Analysis Report.

General Comments:

See the Laboratory Sample Analysis Record section of the Analysis Report for the method references.

All QC met criteria unless otherwise noted in an Analysis Specific Comment below.

Refer to the QC Summary for specific values and acceptance criteria.

Project specific QC samples are not included in this data set.

Matrix QC may not be reported if site-specific QC samples were not submitted. In these situations, to demonstrate precision and accuracy at a batch level, a LCS/LCSD was performed, unless otherwise specified in the method.

Surrogate recoveries (if applicable) which are outside of the QC window are confirmed unless attributed to a dilution or otherwise noted in an Analysis Specific Comment below.

For dual column analyses, the surrogate (for multi-surrogate tests, at least one surrogate) must be within the acceptance limits on at least one of the two columns.

The samples were received at the appropriate temperature and in accordance with the chain of custody unless otherwise noted.

Analysis Specific Comments:

EPA 537 Version 1.1 Modified, Misc. Organics

Sample #s: 9305854

The response for 6:2-FTS in the initial calibration does not meet the method acceptance limits for the linearity of the calibration curve. Since the analyte is not detected in the associated samples, the data is reported.

The stated QC limits are advisory only until sufficient data points can be obtained to calculate statistical limits.

Target analytes were detected in the method blank associated with the samples as noted on the QC Summary. The following corrective action was taken:
This sample was re-extracted within the method holding time and again target analytes were detected in the method blank. The results reported are from the initial trial and comparable results were observed. Both sets of data are provided in the data package.

The recovery for labeled compound used as extraction standard 13C3-PFBS is outside of QC acceptance limits due to the matrix of the sample.

Sample #s: 9305851, 9305853

The response for 6:2-FTS in the initial calibration does not meet the method acceptance limits for the linearity of the calibration curve. Since the analyte is not detected in the associated samples, the data is reported.

Z = The recovery for native compounds 6:2-FTS and 8:2-FTS is outside of QC acceptance limits in the opening calibration

verification standard (CCV). Since the result is high and the native compounds were not detected in the sample, the data is reported.

The stated QC limits are advisory only until sufficient data points can be obtained to calculate statistical limits.

Sample #s: 9305852, 9305855

The response for 6:2-FTS in the initial calibration does not meet the method acceptance limits for the linearity of the calibration curve. Since the analyte is not detected in the associated samples, the data is reported.

Z = The recovery for native compounds 6:2-FTS and 8:2-FTS is outside of QC acceptance limits in the opening calibration verification standard (CCV). Since the result is high and the native compounds were not detected in the sample, the data is reported.

The stated QC limits are advisory only until sufficient data points can be obtained to calculate statistical limits.

Target analytes were detected in the method blank associated with the samples as noted on the QC Summary. The following corrective action was taken:
This sample was re-extracted within the method holding time and again target analytes were detected in the method blank. The results reported are from the initial trial and comparable results were observed. Both sets of data are provided in the data package.

Sample #s: 9305847

The response for 6:2-FTS in the initial calibration does not meet the method acceptance limits for the linearity of the calibration curve. Since the analyte is not detected in the associated samples, the data is reported.

Z = The recovery for native compounds 6:2-FTS and 8:2-FTS is outside of QC acceptance limits in the opening calibration verification standard (CCV). Since the result is high and the native compounds were not detected in the sample, the data is reported.

The stated QC limits are advisory only until sufficient data points can be obtained to calculate statistical limits.

The recovery for labeled compound used as 13C2-PFTeDA is outside of QC acceptance limits as noted on the QC Summary. The data is not impacted by this result.

Sample #s: 9305848

The response for 6:2-FTS in the initial calibration does not meet the method acceptance limits for the linearity of the calibration curve. Since the analyte is not detected in the associated samples, the data is reported.

Z = The recovery for native compounds 6:2-FTS and 8:2-FTS is outside of QC acceptance limits in the opening calibration verification standard (CCV). Since the result is high and

the native compounds were not detected in the sample, the data is reported.

The stated QC limits are advisory only until sufficient data points can be obtained to calculate statistical limits.

The recovery for labeled compound used as extraction standard d3-NMeFOSAA is outside of QC acceptance limits as noted on the QC Summary. Since the result is high and native compound NMeFOSAA is not detected, the data is reported.

Sample #s: 9305849

The response for 6:2-FTS in the initial calibration does not meet the method acceptance limits for the linearity of the calibration curve. Since the analyte is not detected in the associated samples, the data is reported.

Z = The recovery for native compounds 6:2-FTS and 8:2-FTS is outside of QC acceptance limits in the opening calibration verification standard (CCV). Since the result is high and the native compounds were not detected in the sample, the data is reported.

The stated QC limits are advisory only until sufficient data points can be obtained to calculate statistical limits.

The recovery for labeled compound used as extraction standard 13C2-8:2-FTS is outside of QC acceptance limits as noted on the QC Summary. Since the result is high and native compound 8:2-FTS is not detected, the data is reported.

The sample injection internal standard peak areas were outside of the QC limits for both the initial injection and the re-injection. The values here are from the initial injection of the sample.

Sample #s: 9305850

The response for 6:2-FTS in the initial calibration does not meet the method acceptance limits for the linearity of the calibration curve. Since the analyte is not detected in the associated samples, the data is reported.

Z = The recovery for native compounds 6:2-FTS and 8:2-FTS is outside of QC acceptance limits in the opening calibration verification standard (CCV). Since the result is high and the native compounds were not detected in the sample, the data is reported.

The stated QC limits are advisory only until sufficient data points can be obtained to calculate statistical limits.

The recovery for several labeled compounds used as extraction standards is outside of QC acceptance limits as noted on the QC Summary. Since the result is high and the associated native compounds are not detected, the data is reported.

Batch #: 17317002 (Sample number(s): 9305847-9305855)

The recovery(ies) for one or more surrogates exceeded the acceptance window indicating a positive bias for sample(s) 9305848, 9305849, 9305850, 9305854, Blank, LCSD

2425 New Holland Pike, Lancaster, PA 17601 • 717-656-2300 • Fax: 717-656-6766 • www.EurofinsUS.com/LancLabsEnv

The recovery(ies) for one or more surrogates were below the acceptance window for sample(s) 9305847, 9305848, 9305849, 9305850, 9305851, 9305852, 9305853, 9305854, 9305855, LCS, LCSD

The response for 6:2-FTS in the initial calibration does not meet the method acceptance limits for the linearity of the calibration curve. Since the analyte is not detected in the associated samples, the data is reported.

Z = The recovery for native compounds 6:2-FTS and 8:2-FTS is outside of QC acceptance limits in the opening calibration verification standard (CCV). Since the result is high and the native compounds were not detected in the sample, the data is reported.

The stated QC limits are advisory only until sufficient data points can be obtained to calculate statistical limits.

The recovery for labeled compound used as extraction standard 13C2-8:2-FTS is outside of QC acceptance limits as noted on the QC Summary. Since the result is high and native compound 8:2-FTS is not detected, the data is reported.

The sample injection internal standard peak areas were outside of the QC limits for both the initial injection and the re-injection. The values here are from the initial injection of the sample.

*=This limit was used in the evaluation of the final result

The response for 6:2-FTS in the initial calibration does not meet the method acceptance limits for the linearity of the calibration curve. Since the analyte is not detected in the associated samples, the data is reported.

Z = The recovery for native compounds 6:2-FTS and 8:2-FTS is outside of QC acceptance limits in the opening calibration verification standard (CCV). Since the result is high and the native compounds were not detected in the sample, the data is reported.

The stated QC limits are advisory only until sufficient data points can be obtained to calculate statistical limits.

Target analytes were detected in the method blank associated with the samples as noted on the QC Summary. The following corrective action was taken:
This sample was re-extracted within the method holding time and again target analytes were detected in the method blank. The results reported are from the initial trial and comparable results were observed. Both sets of data are provided in the data package.

The response for 6:2-FTS in the initial calibration does not meet the method acceptance limits for the linearity of the calibration curve. Since the analyte is not detected in the associated samples, the data is reported.

The stated QC limits are advisory only until sufficient data points can be obtained to calculate statistical limits.

Target analytes were detected in the method blank associated with the samples as noted on the QC Summary. The following corrective action was taken:
This sample was re-extracted within the method holding time and again target analytes were detected in the method blank. The results reported are from the initial trial and comparable results were observed. Both sets of data are provided in the data package.

The recovery for labeled compound used as extraction standard 13C3-PFBS is outside of QC acceptance limits due to the matrix of the sample.

*=This limit was used in the evaluation of the final result

Quality Control Summary

Client Name: C. T. Male Associates
Reported: 11/21/2017 09:57

Group Number: 1872697

Matrix QC may not be reported if insufficient sample or site-specific QC samples were not submitted. In these situations, to demonstrate precision and accuracy at a batch level, a LCS/LCSD was performed, unless otherwise specified in the method.

All Inorganic Initial Calibration and Continuing Calibration Blanks met acceptable method criteria unless otherwise noted on the Analysis Report.

Explanation of Symbols and Abbreviations

The following defines common symbols and abbreviations used in reporting technical data:

BMQL	Below Minimum Quantitation Level	**mg**	milligram(s)
C	degrees Celsius	**mL**	milliliter(s)
cfu	colony forming units	**MPN**	Most Probable Number
CP Units	cobalt-chloroplatinate units	**N.D.**	non-detect
F	degrees Fahrenheit	**ng**	nanogram(s)
g	gram(s)	**NTU**	nephelometric turbidity units
IU	International Units	**pg/L**	picogram/liter
kg	kilogram(s)	**RL**	Reporting Limit
L	liter(s)	**TNTC**	Too Numerous To Count
lb.	pound(s)	**µg**	microgram(s)
m3	cubic meter(s)	**µL**	microliter(s)
meq	milliequivalents	**umhos/cm**	micromhos/cm

<	less than
>	greater than
ppm	parts per million - One ppm is equivalent to one milligram per kilogram (mg/kg) or one gram per million grams. For aqueous liquids, ppm is usually taken to be equivalent to milligrams per liter (mg/l), because one liter of water has a weight very close to a kilogram. For gases or vapors, one ppm is equivalent to one microliter per liter of gas.
ppb	parts per billion
Dry weight basis	Results printed under this heading have been adjusted for moisture content. This increases the analyte weight concentration to approximate the value present in a similar sample without moisture. All other results are reported on an as-received basis.

Analytical test results meet all requirements of the associated regulatory program (i.e., NELAC (TNI), DoD, and ISO 17025) unless otherwise noted under the individual analysis.

Measurement uncertainty values, as applicable, are available upon request.

Tests results relate only to the sample tested. Clients should be aware that a critical step in a chemical or microbiological analysis is the collection of the sample. Unless the sample analyzed is truly representative of the bulk of material involved, the test results will be meaningless. If you have questions regarding the proper techniques of collecting samples, please contact us. We cannot be held responsible for sample integrity, however, unless sampling has been performed by a member of our staff.

This report shall not be reproduced except in full, without the written approval of the laboratory.

Times are local to the area of activity. Parameters listed in the 40 CFR Part 136 Table II as “analyze immediately” are not performed within 15 minutes.

WARRANTY AND LIMITS OF LIABILITY - In accepting analytical work, we warrant the accuracy of test results for the sample as submitted. THE FOREGOING EXPRESS WARRANTY IS EXCLUSIVE AND IS GIVEN IN LIEU OF ALL OTHER WARRANTIES, EXPRESSED OR IMPLIED. WE DISCLAIM ANY OTHER WARRANTIES, EXPRESSED OR IMPLIED, INCLUDING A WARRANTY OF FITNESS FOR PARTICULAR PURPOSE AND WARRANTY OF MERCHANTABILITY. IN NO EVENT SHALL EUROFINS LANCASTER LABORATORIES ENVIRONMENTAL, LLC BE LIABLE FOR INDIRECT, SPECIAL, CONSEQUENTIAL, OR INCIDENTAL DAMAGES INCLUDING, BUT NOT LIMITED TO, DAMAGES FOR LOSS OF PROFIT OR GOODWILL REGARDLESS OF (A) THE NEGLIGENCE (EITHER SOLE OR CONCURRENT) OF EUROFINS LANCASTER LABORATORIES ENVIRONMENTAL AND (B) WHETHER EUROFINS LANCASTER LABORATORIES ENVIRONMENTAL HAS BEEN INFORMED OF THE POSSIBILITY OF SUCH DAMAGES. We accept no legal responsibility for the purposes for which the client uses the test results. No purchase order or other order for work shall be accepted by Eurofins Lancaster Laboratories Environmental which includes any conditions that vary from the Standard Terms and Conditions, and Eurofins Lancaster Laboratories Environmental hereby objects to any conflicting terms contained in any acceptance or order submitted by client.

eurofins | Lancaster Laboratories Environmental

Data Qualifiers

Qualifier	Definition
C	Result confirmed by reanalysis
D1	Indicates for dual column analyses that the result is reported from column 1
D2	Indicates for dual column analyses that the result is reported from column 2
E	Concentration exceeds the calibration range
J (or G, I, X)	Estimated value >= the Method Detection Limit (MDL or DL) and < the Limit of Quantitation (LOQ or RL)
P	Concentration difference between the primary and confirmation column >40%. The lower result is reported.
U	Analyte was not detected at the value indicated
V	Concentration difference between the primary and confirmation column >100%. The reporting limit is raised due to this disparity and evident interference.
W	The dissolved oxygen uptake for the unseeded blank is greater than 0.20 mg/L.
Z	Laboratory Defined - see analysis report

Additional Organic and Inorganic CLP qualifiers may be used with Form 1 reports as defined by the CLP methods.
Qualifiers specific to Dioxin/Furans and PCB Congeners are detailed on the individual Analysis Report.

General Comments:

See the Laboratory Sample Analysis Record section of the Analysis Report for the method references.

All QC met criteria unless otherwise noted in an Analysis Specific Comment below.

Refer to the QC Summary for specific values and acceptance criteria.

Project specific QC samples are not included in this data set.

Matrix QC may not be reported if site-specific QC samples were not submitted. In these situations, to demonstrate precision and accuracy at a batch level, a LCS/LCSD was performed, unless otherwise specified in the method.

Surrogate recoveries (if applicable) which are outside of the QC window are confirmed unless attributed to a dilution or otherwise noted in an Analysis Specific Comment below.

For dual column analyses, the surrogate (for multi-surrogate tests, at least one surrogate) must be within the acceptance limits on at least one of the two columns.

The samples were received at the appropriate temperature and in accordance with the chain of custody unless otherwise noted.

Analysis Specific Comments:

EPA 537 Version 1.1 Modified, Misc. Organics

Sample #s: 9308296, 9308297

The stated QC limits are advisory only until sufficient data points can be obtained to calculate statistical limits.

The recovery for labeled compound used as extraction standard 13C2-8:2-FTS is outside of QC acceptance limits in the closing calibration verification standard (CCV).

Batch #: 17313011 (Sample number(s): 9308296-9308297)

The recovery(ies) for the following analyte(s) in the LCS and/or LCSD exceeded the acceptance window indicating a positive bias: Perfluorooctanoic acid

The recovery(ies) for one or more surrogates were below the acceptance window for sample(s) 9308296, 9308297, Blank, LCS, LCSD

Quality Control Summary

Client Name: C. T. Male Associates
Reported: 11/10/2017 12:55

Group Number: 1873255

Matrix QC may not be reported if insufficient sample or site-specific QC samples were not submitted. In these situations, to demonstrate precision and accuracy at a batch level, a LCS/LCSD was performed, unless otherwise specified in the method.

All Inorganic Initial Calibration and Continuing Calibration Blanks met acceptable method criteria unless otherwise noted on the Analysis Report.

Method Blank

Sample Administration Receipt Documentation Log

Doc Log ID: 200485

Group Number(s): 1873255

Client: Barr Engineering

Delivery and Receipt Information

Delivery Method:	Fed Ex	Arrival Timestamp:	11/09/2017 9:45
Number of Packages:	1	Number of Projects:	1
State/Province of Origin:	NY		

Arrival Condition Summary

Shipping Container Sealed:	Yes	Sample IDs on COC match Containers:	Yes
Custody Seal Present:	Yes	Sample Date/Times match COC:	Yes
Custody Seal Intact:	Yes	VOA Vial Headspace ≥ 6mm:	N/A
Samples Chilled:	Yes	Total Trip Blank Qty:	2
Paperwork Enclosed:	Yes	Trip Blank Type:	See Below
Samples Intact:	Yes	Air Quality Samples Present:	No
Missing Samples:	No		
Extra Samples:	No		
Discrepancy in Container Qty on COC:	No		

Trip Blank Type(s): Unpreserved (2, 250mL Plastic Bottles)

Unpacked by Wyatt Shiffler (12792) at 11:03 on 11/09/2017

Samples Chilled Details

Thermometer Types: DT = Digital (Temp. Bottle) IR = Infrared (Surface Temp) All Temperatures in °C.

Cooler #	Thermometer ID	Corrected Temp	Therm. Type	Ice Type	Ice Present?	Ice Container	Elevated Temp?
1	DT42-03	1.6	DT	Wet	Y	Bagged	N

Explanation of Symbols and Abbreviations

The following defines common symbols and abbreviations used in reporting technical data:

BMQL	Below Minimum Quantitation Level	**mg**	milligram(s)
C	degrees Celsius	**mL**	milliliter(s)
cfu	colony forming units	**MPN**	Most Probable Number
CP Units	cobalt-chloroplatinate units	**N.D.**	non-detect
F	degrees Fahrenheit	**ng**	nanogram(s)
g	gram(s)	**NTU**	nephelometric turbidity units
IU	International Units	**pg/L**	picogram/liter
kg	kilogram(s)	**RL**	Reporting Limit
L	liter(s)	**TNTC**	Too Numerous To Count
lb.	pound(s)	**µg**	microgram(s)
m3	cubic meter(s)	**µL**	microliter(s)
meq	milliequivalents	**umhos/cm**	micromhos/cm

<	less than
>	greater than
ppm	parts per million - One ppm is equivalent to one milligram per kilogram (mg/kg) or one gram per million grams. For aqueous liquids, ppm is usually taken to be equivalent to milligrams per liter (mg/l), because one liter of water has a weight very close to a kilogram. For gases or vapors, one ppm is equivalent to one microliter per liter of gas.
ppb	parts per billion
Dry weight basis	Results printed under this heading have been adjusted for moisture content. This increases the analyte weight concentration to approximate the value present in a similar sample without moisture. All other results are reported on an as-received basis.

Analytical test results meet all requirements of the associated regulatory program (i.e., NELAC (TNI), DoD, and ISO 17025) unless otherwise noted under the individual analysis.

Measurement uncertainty values, as applicable, are available upon request.

Tests results relate only to the sample tested. Clients should be aware that a critical step in a chemical or microbiological analysis is the collection of the sample. Unless the sample analyzed is truly representative of the bulk of material involved, the test results will be meaningless. If you have questions regarding the proper techniques of collecting samples, please contact us. We cannot be held responsible for sample integrity, however, unless sampling has been performed by a member of our staff.

This report shall not be reproduced except in full, without the written approval of the laboratory.

Times are local to the area of activity. Parameters listed in the 40 CFR Part 136 Table II as “analyze immediately” are not performed within 15 minutes.

WARRANTY AND LIMITS OF LIABILITY - In accepting analytical work, we warrant the accuracy of test results for the sample as submitted. THE FOREGOING EXPRESS WARRANTY IS EXCLUSIVE AND IS GIVEN IN LIEU OF ALL OTHER WARRANTIES, EXPRESSED OR IMPLIED. WE DISCLAIM ANY OTHER WARRANTIES, EXPRESSED OR IMPLIED, INCLUDING A WARRANTY OF FITNESS FOR PARTICULAR PURPOSE AND WARRANTY OF MERCHANTABILITY. IN NO EVENT SHALL EUROFINS LANCASTER LABORATORIES ENVIRONMENTAL, LLC BE LIABLE FOR INDIRECT, SPECIAL, CONSEQUENTIAL, OR INCIDENTAL DAMAGES INCLUDING, BUT NOT LIMITED TO, DAMAGES FOR LOSS OF PROFIT OR GOODWILL REGARDLESS OF (A) THE NEGLIGENCE (EITHER SOLE OR CONCURRENT) OF EUROFINS LANCASTER LABORATORIES ENVIRONMENTAL AND (B) WHETHER EUROFINS LANCASTER LABORATORIES ENVIRONMENTAL HAS BEEN INFORMED OF THE POSSIBILITY OF SUCH DAMAGES. We accept no legal responsibility for the purposes for which the client uses the test results. No purchase order or other order for work shall be accepted by Eurofins Lancaster Laboratories Environmental which includes any conditions that vary from the Standard Terms and Conditions, and Eurofins Lancaster Laboratories Environmental hereby objects to any conflicting terms contained in any acceptance or order submitted by client.

eurofins | Lancaster Laboratories Environmental

Data Qualifiers

Qualifier	Definition
C	Result confirmed by reanalysis
D1	Indicates for dual column analyses that the result is reported from column 1
D2	Indicates for dual column analyses that the result is reported from column 2
E	Concentration exceeds the calibration range
J (or G, I, X)	Estimated value >= the Method Detection Limit (MDL or DL) and < the Limit of Quantitation (LOQ or RL)
P	Concentration difference between the primary and confirmation column >40%. The lower result is reported.
U	Analyte was not detected at the value indicated
V	Concentration difference between the primary and confirmation column >100%. The reporting limit is raised due to this disparity and evident interference.
W	The dissolved oxygen uptake for the unseeded blank is greater than 0.20 mg/L.
Z	Laboratory Defined - see analysis report

Additional Organic and Inorganic CLP qualifiers may be used with Form 1 reports as defined by the CLP methods.
Qualifiers specific to Dioxin/Furans and PCB Congeners are detailed on the individual Analysis Report.

General Comments:

See the Laboratory Sample Analysis Record section of the Analysis Report for the method references.

All QC met criteria unless otherwise noted in an Analysis Specific Comment below.

Refer to the QC Summary for specific values and acceptance criteria.

Project specific QC samples are not included in this data set.

Matrix QC may not be reported if site-specific QC samples were not submitted. In these situations, to demonstrate precision and accuracy at a batch level, a LCS/LCSD was performed, unless otherwise specified in the method.

Surrogate recoveries (if applicable) which are outside of the QC window are confirmed unless attributed to a dilution or otherwise noted in an Analysis Specific Comment below.

For dual column analyses, the surrogate (for multi-surrogate tests, at least one surrogate) must be within the acceptance limits on at least one of the two columns.

The samples were received at the appropriate temperature and in accordance with the chain of custody unless otherwise noted.

Analysis Specific Comments:

EPA 537 Version 1.1 Modified, Misc. Organics

Sample #s: 9311674, 9311675, 9311676

The stated QC limits are advisory only until sufficient data points can be obtained to calculate statistical limits.

The recovery for labeled compound used as extraction standard 13C2-PFTeDA is outside of QC acceptance limits as noted on the QC Summary in the method blank. The data quality is not impacted by this result.

Batch #: 17314009 (Sample number(s): 9311674-9311676)

The recovery(ies) for the following analyte(s) in the LCS and/or LCSD exceeded the acceptance window indicating a positive bias: Perfluorotridecanoic acid, Perfluorotetradecanoic acid, Perfluoroheptanoic acid, Perfluoropentanoic acid, NEtFOSAA, NMeFOSAA

The recovery(ies) for one or more surrogates were below the acceptance window for sample(s) 9311674, 9311675, 9311676, Blank, LCS, LCSD

Quality Control Summary

Client Name: C. T. Male Associates
Reported: 11/11/2017 08:51

Group Number: 1873987

Matrix QC may not be reported if insufficient sample or site-specific QC samples were not submitted. In these situations, to demonstrate precision and accuracy at a batch level, a LCS/LCSD was performed, unless otherwise specified in the method.

All Inorganic Initial Calibration and Continuing Calibration Blanks met acceptable method criteria unless otherwise noted on the Analysis Report.

Method Blank

Analysis Name	Result ng/l	MDL** ng/l	LOQ ng/l
Batch number: 17314009	Sample number(s): 9311674-9311676

Explanation of Symbols and Abbreviations

The following defines common symbols and abbreviations used in reporting technical data:

BMQL	Below Minimum Quantitation Level	**mg**	milligram(s)
C	degrees Celsius	**mL**	milliliter(s)
cfu	colony forming units	**MPN**	Most Probable Number
CP Units	cobalt-chloroplatinate units	**N.D.**	non-detect
F	degrees Fahrenheit	**ng**	nanogram(s)
g	gram(s)	**NTU**	nephelometric turbidity units
IU	International Units	**pg/L**	picogram/liter
kg	kilogram(s)	**RL**	Reporting Limit
L	liter(s)	**TNTC**	Too Numerous To Count
lb.	pound(s)	**µg**	microgram(s)
m3	cubic meter(s)	**µL**	microliter(s)
meq	milliequivalents	**umhos/cm**	micromhos/cm

<	less than
>	greater than
ppm	parts per million - One ppm is equivalent to one milligram per kilogram (mg/kg) or one gram per million grams. For aqueous liquids, ppm is usually taken to be equivalent to milligrams per liter (mg/l), because one liter of water has a weight very close to a kilogram. For gases or vapors, one ppm is equivalent to one microliter per liter of gas.
ppb	parts per billion
Dry weight basis	Results printed under this heading have been adjusted for moisture content. This increases the analyte weight concentration to approximate the value present in a similar sample without moisture. All other results are reported on an as-received basis.

Analytical test results meet all requirements of the associated regulatory program (i.e., NELAC (TNI), DoD, and ISO 17025) unless otherwise noted under the individual analysis.

Measurement uncertainty values, as applicable, are available upon request.

Tests results relate only to the sample tested. Clients should be aware that a critical step in a chemical or microbiological analysis is the collection of the sample. Unless the sample analyzed is truly representative of the bulk of material involved, the test results will be meaningless. If you have questions regarding the proper techniques of collecting samples, please contact us. We cannot be held responsible for sample integrity, however, unless sampling has been performed by a member of our staff.

This report shall not be reproduced except in full, without the written approval of the laboratory.

Times are local to the area of activity. Parameters listed in the 40 CFR Part 136 Table II as “analyze immediately” are not performed within 15 minutes.

WARRANTY AND LIMITS OF LIABILITY - In accepting analytical work, we warrant the accuracy of test results for the sample as submitted. THE FOREGOING EXPRESS WARRANTY IS EXCLUSIVE AND IS GIVEN IN LIEU OF ALL OTHER WARRANTIES, EXPRESSED OR IMPLIED. WE DISCLAIM ANY OTHER WARRANTIES, EXPRESSED OR IMPLIED, INCLUDING A WARRANTY OF FITNESS FOR PARTICULAR PURPOSE AND WARRANTY OF MERCHANTABILITY. IN NO EVENT SHALL EUROFINS LANCASTER LABORATORIES ENVIRONMENTAL, LLC BE LIABLE FOR INDIRECT, SPECIAL, CONSEQUENTIAL, OR INCIDENTAL DAMAGES INCLUDING, BUT NOT LIMITED TO, DAMAGES FOR LOSS OF PROFIT OR GOODWILL REGARDLESS OF (A) THE NEGLIGENCE (EITHER SOLE OR CONCURRENT) OF EUROFINS LANCASTER LABORATORIES ENVIRONMENTAL AND (B) WHETHER EUROFINS LANCASTER LABORATORIES ENVIRONMENTAL HAS BEEN INFORMED OF THE POSSIBILITY OF SUCH DAMAGES. We accept no legal responsibility for the purposes for which the client uses the test results. No purchase order or other order for work shall be accepted by Eurofins Lancaster Laboratories Environmental which includes any conditions that vary from the Standard Terms and Conditions, and Eurofins Lancaster Laboratories Environmental hereby objects to any conflicting terms contained in any acceptance or order submitted by client.

Data Qualifiers

Qualifier	Definition
C	Result confirmed by reanalysis
D1	Indicates for dual column analyses that the result is reported from column 1
D2	Indicates for dual column analyses that the result is reported from column 2
E	Concentration exceeds the calibration range
J (or G, I, X)	Estimated value >= the Method Detection Limit (MDL or DL) and < the Limit of Quantitation (LOQ or RL)
P	Concentration difference between the primary and confirmation column >40%. The lower result is reported.
U	Analyte was not detected at the value indicated
V	Concentration difference between the primary and confirmation column >100%. The reporting limit is raised due to this disparity and evident interference.
W	The dissolved oxygen uptake for the unseeded blank is greater than 0.20 mg/L.
Z	Laboratory Defined - see analysis report

Additional Organic and Inorganic CLP qualifiers may be used with Form 1 reports as defined by the CLP methods.
Qualifiers specific to Dioxin/Furans and PCB Congeners are detailed on the individual Analysis Report.

ELLE Group #: 1874450

General Comments:

See the Laboratory Sample Analysis Record section of the Analysis Report for the method references.

All QC met criteria unless otherwise noted in an Analysis Specific Comment below.

Refer to the QC Summary for specific values and acceptance criteria.

Project specific QC samples are not included in this data set.

Matrix QC may not be reported if site-specific QC samples were not submitted. In these situations, to demonstrate precision and accuracy at a batch level, a LCS/LCSD was performed, unless otherwise specified in the method.

Surrogate recoveries (if applicable) which are outside of the QC window are confirmed unless attributed to a dilution or otherwise noted in an Analysis Specific Comment below.

For dual column analyses, the surrogate (for multi-surrogate tests, at least one surrogate) must be within the acceptance limits on at least one of the two columns.

The samples were received at the appropriate temperature and in accordance with the chain of custody unless otherwise noted.

Analysis Specific Comments:

EPA 537 Version 1.1 Modified, Misc. Organics

Sample #s: 9313910

The stated QC limits are advisory only until sufficient data points can be obtained to calculate statistical limits.

The response for native compound 6:2-FTS in the initial calibration does not meet the method acceptance limits for the linearity of the calibration curve. Since the analyte is not detected in the associated sample, the data is reported.

The recovery for several labeled compounds used as extraction standards is outside of QC acceptance limits in the method blank. Since the recovery is high and the associated native compound is not detected, the data is reported.

The LCS/LCSD labeled compounds used as extraction standards recovery is outside the QC acceptance limits as noted on the QC Summary. Since the recovery for the target analytes is compliant, the data is reported.

Batch #: 17317002 (Sample number(s): 9313910)

The recovery(ies) for one or more surrogates exceeded the acceptance window indicating a positive bias for sample(s) Blank, LCSD

The recovery(ies) for one or more surrogates were below the acceptance window for sample(s) 9313910, LCS, LCSD

Quality Control Summary

Client Name: C. T. Male Associates
Reported: 11/15/2017 07:16

Group Number: 1874450

Matrix QC may not be reported if insufficient sample or site-specific QC samples were not submitted. In these situations, to demonstrate precision and accuracy at a batch level, a LCS/LCSD was performed, unless otherwise specified in the method.

All Inorganic Initial Calibration and Continuing Calibration Blanks met acceptable method criteria unless otherwise noted on the Analysis Report.

Surrogate Quality Control

Surrogate recoveries which are outside of the QC window are confirmed unless attributed to dilution or otherwise noted on the Analysis Report. For dual column analyses, the surrogate (at least one surrogate for multi-surrogate tests) must be within the acceptance limits on at least one of the two columns.

Explanation of Symbols and Abbreviations

The following defines common symbols and abbreviations used in reporting technical data:

BMQL	Below Minimum Quantitation Level	**mg**	milligram(s)
C	degrees Celsius	**mL**	milliliter(s)
cfu	colony forming units	**MPN**	Most Probable Number
CP Units	cobalt-chloroplatinate units	**N.D.**	non-detect
F	degrees Fahrenheit	**ng**	nanogram(s)
g	gram(s)	**NTU**	nephelometric turbidity units
IU	International Units	**pg/L**	picogram/liter
kg	kilogram(s)	**RL**	Reporting Limit
L	liter(s)	**TNTC**	Too Numerous To Count
lb.	pound(s)	**µg**	microgram(s)
m3	cubic meter(s)	**µL**	microliter(s)
meq	milliequivalents	**umhos/cm**	micromhos/cm

<	less than
>	greater than
ppm	parts per million - One ppm is equivalent to one milligram per kilogram (mg/kg) or one gram per million grams. For aqueous liquids, ppm is usually taken to be equivalent to milligrams per liter (mg/l), because one liter of water has a weight very close to a kilogram. For gases or vapors, one ppm is equivalent to one microliter per liter of gas.
ppb	parts per billion
Dry weight basis	Results printed under this heading have been adjusted for moisture content. This increases the analyte weight concentration to approximate the value present in a similar sample without moisture. All other results are reported on an as-received basis.

Analytical test results meet all requirements of the associated regulatory program (i.e., NELAC (TNI), DoD, and ISO 17025) unless otherwise noted under the individual analysis.

Measurement uncertainty values, as applicable, are available upon request.

Tests results relate only to the sample tested. Clients should be aware that a critical step in a chemical or microbiological analysis is the collection of the sample. Unless the sample analyzed is truly representative of the bulk of material involved, the test results will be meaningless. If you have questions regarding the proper techniques of collecting samples, please contact us. We cannot be held responsible for sample integrity, however, unless sampling has been performed by a member of our staff.

This report shall not be reproduced except in full, without the written approval of the laboratory.

Times are local to the area of activity. Parameters listed in the 40 CFR Part 136 Table II as “analyze immediately” are not performed within 15 minutes.

WARRANTY AND LIMITS OF LIABILITY - In accepting analytical work, we warrant the accuracy of test results for the sample as submitted. THE FOREGOING EXPRESS WARRANTY IS EXCLUSIVE AND IS GIVEN IN LIEU OF ALL OTHER WARRANTIES, EXPRESSED OR IMPLIED. WE DISCLAIM ANY OTHER WARRANTIES, EXPRESSED OR IMPLIED, INCLUDING A WARRANTY OF FITNESS FOR PARTICULAR PURPOSE AND WARRANTY OF MERCHANTABILITY. IN NO EVENT SHALL EUROFINS LANCASTER LABORATORIES ENVIRONMENTAL, LLC BE LIABLE FOR INDIRECT, SPECIAL, CONSEQUENTIAL, OR INCIDENTAL DAMAGES INCLUDING, BUT NOT LIMITED TO, DAMAGES FOR LOSS OF PROFIT OR GOODWILL REGARDLESS OF (A) THE NEGLIGENCE (EITHER SOLE OR CONCURRENT) OF EUROFINS LANCASTER LABORATORIES ENVIRONMENTAL AND (B) WHETHER EUROFINS LANCASTER LABORATORIES ENVIRONMENTAL HAS BEEN INFORMED OF THE POSSIBILITY OF SUCH DAMAGES. We accept no legal responsibility for the purposes for which the client uses the test results. No purchase order or other order for work shall be accepted by Eurofins Lancaster Laboratories Environmental which includes any conditions that vary from the Standard Terms and Conditions, and Eurofins Lancaster Laboratories Environmental hereby objects to any conflicting terms contained in any acceptance or order submitted by client.

eurofins | Lancaster Laboratories Environmental

Data Qualifiers

Qualifier	Definition
C	Result confirmed by reanalysis
D1	Indicates for dual column analyses that the result is reported from column 1
D2	Indicates for dual column analyses that the result is reported from column 2
E	Concentration exceeds the calibration range
J (or G, I, X)	Estimated value >= the Method Detection Limit (MDL or DL) and < the Limit of Quantitation (LOQ or RL)
P	Concentration difference between the primary and confirmation column >40%. The lower result is reported.
U	Analyte was not detected at the value indicated
V	Concentration difference between the primary and confirmation column >100%. The reporting limit is raised due to this disparity and evident interference.
W	The dissolved oxygen uptake for the unseeded blank is greater than 0.20 mg/L.
Z	Laboratory Defined - see analysis report

Additional Organic and Inorganic CLP qualifiers may be used with Form 1 reports as defined by the CLP methods.
Qualifiers specific to Dioxin/Furans and PCB Congeners are detailed on the individual Analysis Report.

General Comments:

See the Laboratory Sample Analysis Record section of the Analysis Report for the method references.

All QC met criteria unless otherwise noted in an Analysis Specific Comment below. Refer to the QC Summary for specific values and acceptance criteria.

Project specific QC samples are included in this data set

Matrix QC may not be reported if site-specific QC samples were not submitted. In these situations, to demonstrate precision and accuracy at a batch level, a LCS/LCSD was performed, unless otherwise specified in the method.

Surrogate recoveries (if applicable) which are outside of the QC window are confirmed unless attributed to a dilution or otherwise noted in an Analysis Specific Comment below.

The samples were received at the appropriate temperature and in accordance with the chain of custody unless otherwise noted.

Analysis Specific Comments:

SW-846 8270D SIM, GC/MS Semivolatiles

Sample #s: 9016127, 9016128, 9016129, 9016130, 9016131, 9016135, 9016136, 9016137, 9016140, 9016141

The surrogate QC limits are advisory only until sufficient data points can be obtained to calculate statistical limits.

Batch #: 17150WAP026 (Sample number(s): 9016127-9016131, 9016135-9016137, 9016140-9016141 UNSPK: 9016129)

The recovery(ies) for one or more surrogates were below the acceptance window for sample(s) 9016127, 9016128, 9016129, 9016130, 9016131, 9016135, 9016136, 9016137, 9016140, 9016141, Blank, LCS, MS, MSD

EPA 537 Rev. 1.1 modified, Misc. Organics

Sample #s: 9016128, 9016129, 9016130, 9016131, 9016133, 9016134, 9016135, 9016136, 9016137, 9016138, 9016139, 9016141

The stated QC limits are advisory only until sufficient data points can be obtained to calculate statistical limits.

Sample #s: 9016127, 9016140

The stated QC limits are advisory only until sufficient data points can be obtained to calculate statistical limits.

The injection internal standard peak areas were outside of the QC limits for both the initial injection and the re-injection. The values here are from the initial injection of the sample.

Batch #: 17151004 (Sample number(s): 9016127-9016131, 9016133-9016141 UNSPK: 9016129)

The recovery(ies) for one or more surrogates exceeded the acceptance window

indicating a positive bias for sample(s) 9016127, 9016140, 9016141

The recovery(ies) for one or more surrogates were below the acceptance window for sample(s) 9016127, 9016128, 9016129, 9016130, 9016131, 9016133, 9016134, 9016135, 9016136, 9016137, 9016138, 9016139, 9016140, 9016141, Blank, LCS, MS, MSD

SW-846 6010C, Metals

Batch #: 171461063501 (Sample number(s): 9016127-9016132, 9016135-9016137, 9016140-9016141 UNSPK: 9016129 BKG: 9016129)

The recovery(ies) for the following analyte(s) in the MS and/or MSD exceeded the acceptance window indicating a positive bias: Calcium, Magnesium

SW-846 6020A, Metals

Batch #: 171461063903A (Sample number(s): 9016127-9016132, 9016135-9016137, 9016140-9016141 UNSPK: 9016129 BKG: 9016129)

The recovery(ies) for the following analyte(s) in the LCS exceeded the acceptance window indicating a positive bias: Cadmium

The recovery(ies) for the following analyte(s) in the MS and/or MSD exceeded the acceptance window indicating a positive bias: Antimony, Cadmium

The duplicate RPD for the following analyte(s) exceeded the acceptance window: Chromium

SW-846 9012A, Wet Chemistry

Batch #: 17153117101A (Sample number(s): 9016140-9016141 UNSPK: P17257 BKG: P17257)

The recovery(ies) for the following analyte(s) in the MS were below the acceptance window: Total Cyanide (water)

SM 2320 B-1997, Wet Chemistry

Batch #: 17150002202A (Sample number(s): 9016127, 9016129-9016132, 9016135-9016137, 9016140 UNSPK: 9016129 BKG: P9016129-P16141)

The recovery(ies) for the following analyte(s) in the MS and/or MSD were below the acceptance window: Total Alkalinity to pH 4.5

Batch #: 17150002202B (Sample number(s): 9016141 UNSPK: P16129 BKG: P16129, P9016141)

The recovery(ies) for the following analyte(s) in the MS and/or MSD were below the acceptance window: Total Alkalinity to pH 4.5

SM 4500-P E-1999, Wet Chemistry

Sample #s: 9016127, 9016128, 9016129, 9016130, 9016131, 9016132

The holding time was not met. The sample was submitted to the laboratory with insufficient time remaining in the holding time.

FORM I VOA-TIC

Quality Control Summary

Client Name: C. T. Male Associates
Group Number: 1806183
Reported: 06/19/2017 16:10

Matrix QC may not be reported if insufficient sample or site-specific QC samples were not submitted. In these situations, to demonstrate precision and accuracy at a batch level, a LCS/LCSD was performed, unless otherwise specified in the method.

All Inorganic Initial Calibration and Continuing Calibration Blanks met acceptable method criteria unless otherwise noted on the Analysis Report.

Preservation Codes

H = HCl T = Thiosulfate

N = HNO_3 B = NaOH

S = H_2SO_4 P = H_3PO_4

O = Other

Remarks

ortho-PO4, NO2 and NO3 have a 48 hr hold time *

Turnaround Time Requested (TAT) (please check): Standard ☒ RUSH *

(RUSH TAT is subject to Eurofins Lancaster Laboratories approval and surcharges.)

Date results are needed:

E-mail address to send RUSH results: k.moline@ctmale.com

Data Package Options (please check if required)

Type I (Validation/non-CLP) ☑ MA MCP ☐ TX TRRP - 13 ☐

Type III (Reduced non-CLP) ☐ CT RCP ☐

Type IV (CLP SOW) ☐ ASP Type A ☐

Type VI (Raw Data Only) ☐ ASP Type B ☐

EDD Format: EQuIS

If site-specific QC (MS/MSD/Dup) required, indicate QC samples and submit triplicate volume.

Explanation of Symbols and Abbreviations

The following defines common symbols and abbreviations used in reporting technical data:

BMQL	Below Minimum Quantitation Level	**mg**	milligram(s)
C	degrees Celsius	**mL**	milliliter(s)
cfu	colony forming units	**MPN**	Most Probable Number
CP Units	cobalt-chloroplatinate units	**N.D.**	none detected
F	degrees Fahrenheit	**ng**	nanogram(s)
g	gram(s)	**NTU**	nephelometric turbidity units
IU	International Units	**pg/L**	picogram/liter
kg	kilogram(s)	**RL**	Reporting Limit
L	liter(s)	**TNTC**	Too Numerous To Count
lb.	pound(s)	**µg**	microgram(s)
m3	cubic meter(s)	**µL**	microliter(s)
meq	milliequivalents	**umhos/cm**	micromhos/cm

< less than

> greater than

ppm parts per million - One ppm is equivalent to one milligram per kilogram (mg/kg) or one gram per million grams. For aqueous liquids, ppm is usually taken to be equivalent to milligrams per liter (mg/l), because one liter of water has a weight very close to a kilogram. For gases or vapors, one ppm is equivalent to one microliter per liter of gas.

ppb parts per billion

Dry weight basis Results printed under this heading have been adjusted for moisture content. This increases the analyte weight concentration to approximate the value present in a similar sample without moisture. All other results are reported on an as-received basis.

Laboratory Data Qualifiers:

C - Result confirmed by reanalysis
E - Concentration exceeds the calibration range
J (or G, I, X) - estimated value ≥ the Method Detection Limit (MDL or DL) and < the Limit of Quantitation (LOQ or RL)
P - Concentration difference between the primary and confirmation column >40%. The lower result is reported.
U - Analyte was not detected at the value indicated
V - Concentration difference between the primary and confirmation column >100%. The reporting limit is raised due to this disparity and evident interference…
W - The dissolved oxygen uptake for the unseeded blank is greater than 0.20 mg/L.

Additional Organic and Inorganic CLP qualifiers may be used with Form 1 reports as defined by the CLP methods.
Qualifiers specific to Dioxin/Furans and PCB Congeners are detailed on the individual Analysis Report.

Analytical test results meet all requirements of the associated regulatory program (i.e., NELAC (TNI), DoD, and ISO 17025) unless otherwise noted under the individual analysis.

Measurement uncertainty values, as applicable, are available upon request.

Tests results relate only to the sample tested. Clients should be aware that a critical step in a chemical or microbiological analysis is the collection of the sample. Unless the sample analyzed is truly representative of the bulk of material involved, the test results will be meaningless. If you have questions regarding the proper techniques of collecting samples, please contact us. We cannot be held responsible for sample integrity, however, unless sampling has been performed by a member of our staff.

This report shall not be reproduced except in full, without the written approval of the laboratory.

Times are local to the area of activity. Parameters listed in the 40 CFR Part 136 Table II as “analyze immediately” are not performed within 15 minutes.

WARRANTY AND LIMITS OF LIABILITY - In accepting analytical work, we warrant the accuracy of test results for the sample as submitted. THE FOREGOING EXPRESS WARRANTY IS EXCLUSIVE AND IS GIVEN IN LIEU OF ALL OTHER WARRANTIES, EXPRESSED OR IMPLIED. WE DISCLAIM ANY OTHER WARRANTIES, EXPRESSED OR IMPLIED, INCLUDING A WARRANTY OF FITNESS FOR PARTICULAR PURPOSE AND WARRANTY OF MERCHANTABILITY. IN NO EVENT SHALL EUROFINS LANCASTER LABORATORIES ENVIRONMENTAL, LLC BE LIABLE FOR INDIRECT, SPECIAL, CONSEQUENTIAL, OR INCIDENTAL DAMAGES INCLUDING, BUT NOT LIMITED TO, DAMAGES FOR LOSS OF PROFIT OR GOODWILL REGARDLESS OF (A) THE NEGLIGENCE (EITHER SOLE OR CONCURRENT) OF EUROFINS LANCASTER LABORATORIES ENVIRONMENTAL AND (B) WHETHER EUROFINS LANCASTER LABORATORIES ENVIRONMENTAL HAS BEEN INFORMED OF THE POSSIBILITY OF SUCH DAMAGES. We accept no legal responsibility for the purposes for which the client uses the test results. No purchase order or other order for work shall be accepted by Eurofins Lancaster Laboratories Environmental which includes any conditions that vary from the Standard Terms and Conditions, and Eurofins Lancaster Laboratories Environmental hereby objects to any conflicting terms contained in any acceptance or order submitted by client.

QAQC Analytical Data

DRAFT

Table C.1.1
Footnote and Qualifier Definitions
CSM Site Investigation Report
Bennington, VT
Saint-Gobain Performance Plastics

Footnote / Qualifier	Definition
--	Not analyzed/Not available.
N	Sample Type: Normal
FD	Sample Type: Field Duplicate
*	Estimated value, QA/QC criteria not met.
**	Unusable value, QA/QC criteria not met.
a	Estimated value, calculated using some or all values that are estimates.
b	Potential false positive value based on blank data validation procedures. Concentrations identified as potential false positive are excluded from calculations.
J	The result is an estimated quantity. The associated numerical value is the approximate concentration of the analyte in the sample.
N	The analyte has been "tentatively identified" or considered "presumptively" present.
R	The data are unusable. The sample results are rejected due to serious deficiencies in meeting QC criteria. The analyte may or may not be present in the sample.
U	The analyte was analyzed for, but was not detected above the level of the reported sample method detection limit (MDL).
UB	The Analyte was not detected substantially above the level reported in the associated laboratory, equipment, field, or trip blank.
UJ	The analyte was analyzed for, but was not detected. The reported MDL and limit of quantitation (LOQ) are approximate and may be inaccurate or imprecise.

Parameter	Units	
General Parameters		
Alkalinity, bicarbonate, as CaCO3	mg/l	< 1.7 U
Alkalinity, carbonate, as CaCO3	mg/l	< 1.7 U
Alkalinity, total, as CaCO3	mg/l	< 1.7 U
Bromide	mg/l	< 0.25 U
Chloride	mg/l	**0.23 J**
Cyanide	mg/l	< 0.0050 U
Nitrogen, ammonia, as N	mg/l	< 0.050 U
Nitrogen, nitrate, as N	mg/l	< 0.050 U
Nitrogen, nitrite, as N	mg/l	< 0.050 U
Nitrogen, total kjeldahl (TKN)	mg/l	< 0.50 U
Orthophosphate, as P	mg/l	< 0.030 U
Sulfate, as SO4	mg/l	< 0.30 U
Metals		
Aluminum	mg/l	< 0.0868 U
Antimony	mg/l	< 0.00048 U
Arsenic	mg/l	< 0.00068 U
Barium	mg/l	< 0.00096 U
Beryllium	mg/l	< 0.00011 U
Boron	mg/l	< 0.0083 U
Cadmium	mg/l	< 0.00019 U
Calcium	mg/l	**0.0723 J**
Chromium	mg/l	< 0.00059 U
Cobalt	mg/l	< 0.00020 U
Copper	mg/l	< 0.00052 U
Iron	mg/l	< 0.0747 U
Lead	mg/l	< 0.000090 U
Magnesium	mg/l	< 0.0190 U
Manganese	mg/l	< 0.00088 U
Mercury	mg/l	< 0.000050 U
Nickel	mg/l	< 0.00085 U
Potassium	mg/l	< 0.160 U
Selenium	mg/l	< 0.00044 U
Silver	mg/l	< 0.00012 U
Sodium	mg/l	**0.224 J**
Thallium	mg/l	< 0.00016 U
Vanadium	mg/l	**0.00021 J**
Zinc	mg/l	< 0.0054 U
SVOCs		
1,4-Dioxane	ug/l	< 0.051 UJ

Appendix C.2

Analytical Data Validation

validation reports provided upon request

DRAFT

ENVIRONMENTAL® STANDARDS 30 YEARS 1987 - 2017
Setting the Standards for Innovative Environmental Solutions

DRAFT

NOTE:

The information in this summary is based on the data available on November 20, 2017, the statistics will be updated upon completion of the data validation effort.

Background

For the Village of North Bennington Vermont Site, C.T. Male and Barr collectively submitted 130 sample delivery groups (SDGs) of soil and aqueous samples (including groundwater and quality control [QC] samples) to Eurofins Lancaster Laboratories Environmental, LLC. (ELLE), for analyses. The 130 SDGs encompassed a total of 785 samples including 727 soil samples. Of the total 785 samples, 648 samples were analyzed for perfluorinated and polyfluorinated alkyl substances (PFASs).

ELLE provided an electronic data deliverable (EDD), a limited data package (equivalent to a New York State Department of Environmental Conservation [NYSDEC] Analytical Services Protocol [ASP] Category A deliverable), and a full data package (equivalent to a NYSDEC ASP Category B deliverable) for each SDG. These data were received by Environmental Standards, Inc. (Environmental Standards), for management of the project database and data quality assessment activities.

Data validation was performed by Environmental Standards in accordance with the "Initial Site Characterization Investigation Work Plan Saint-Gobain Performance Plastics Site 1030 Water Street, Village of North Bennington, Bennington County Vermont" (Work Plan, April 2016). A minimum of 10% of the investigative samples will be randomly selected for full data validation (*e.g.*, Category B). The remaining 90% of investigative samples will undergo a limited data validation effort (*e.g.*, Category A or DUSR).

Collectively, for analyses included in the project, the full data validation, labeled as Category B in the database, includes the rigorous review of all tabulated QC summary forms and raw data associated with the following QC measures.

Table 1: Category B Data Validation Elements

- Preparation and analysis holding times
- Blank analysis results
- Second-source initial calibration verification (ICV) recoveries
- Laboratory control sample/laboratory control sample duplicate (LCS/LCSD) results
- Sample condition upon laboratory receipt
- Initial calibrations
- Continuing calibration verification (CCV) recoveries
- Matrix spike/matrix spike duplicate (MS/MSD) results

Table 1: Category B Data Validation Elements

- Surrogate compound recoveries
- TIC evaluation
- Labeled pre-extraction internal standard recoveries
- Qualitative identification
- Field duplicate precision
- Detection limit standard results
- Serial dilution results
- Inductively coupled plasma-mass spectrometry (ICP-MS) internal standard results
- Mass spectrometer tuning injections
- Analytical sequence
- Pre-injection internal standard responses
- Quantitation of results
- Calibration check standard recoveries
- Interference check sample results
- Post-digestion spike results

Collectively, for analyses included in the project, the limited data validation, labeled as DUSR in the database, includes the review of all tabulated QC summary forms associated with the following QC measures; however, raw data was not evaluated.

Table 2: DUSR Data Validation Elements

Collectively, for analyses included in the project, the limited data validation, labeled as Category A in the database, includes the review of the tabulated QC summary forms associated with the following QC measures; however, raw data was not evaluated.

Table 3: Category A Data Validation Elements

- Preparation and analysis holding times
- Blank analysis results
- LCS/LCSD results
- Surrogate recoveries
- Sample condition upon laboratory receipt
- MS/MSD results
- Labeled pre-extraction internal standard recoveries

A summary of the data validation performed for the investigative samples and associated field duplicate samples is presented in Table 4. The percent Category B is determined by the following equation.

Percent Category B Calculation

$$= \frac{\text{Number of Results Category B}}{\text{Total Number of Results}} \text{x} 100$$

Table 4: Percent Category B Validation for Each Matrix and Method Code				
Method Code	Method Definition	Soil %	Ground Water %	Soil/Water Quality %
D422	Grain Size	12	--	--
E300.0	Anions	--	15	--
E350.1	Ammonia Nitrogen	--	35	--
E351.2	Total Kjeldahl Nitrogen	--	35	--
E537	PFAS	11	74	73
SM 2540G	Percent Moisture	11	--	50
SM2320B	Alkalinity	--	15	--
SM4500-P-E	Orthophosphate	--	34	--
SM5310B	Total Organic Carbon	11	--	50
SW6010C	ICP Metals	8	14	50
SW6020A	ICP-MS Metals	8	14	50

SW7471B	Mercury	12	--	--
SW8081B	Pesticides	67	--	--
SW8082A	Polychlorinated Biphenyls	67	--	--
SW8260C	Volatile Organic Compounds	67	17	50
8270D	Semivolatile Organic Compounds (SVOC)	67	--	--
SW8270DSIM	SVOC with Selected Ion Monitoring	--	56	--
SW9012A	Cyanide	67	17	--
SW9045	pH	11	--	50

Overall Data Usability and Qualification

The 785 samples collected and analyzed generated a total of 23,148 results and, specifically, 9,337 PFAS results. Based on the data validation performed, three (3) of the results were qualified as "unusable." Two (2) of the PFAS results were qualified as "unusable" due to very low internal standard recoveries. One (1) pesticide result was qualified as "unusable" due to a high performance evaluation mixture (DDT breakdown) result. *Overall, the percentage of usable results was determined to be 99.99% with 0.01% unusable results*. *For PFCs, the percentage of usable results was determined to be 99.98% with 0.02% unusable results.*

Based on the data validation performed overall, 5,696 results were qualified (*e.g.*, "J," "JN," "R," "UB," or "UJ) due reason identified in the validation reports. The percentage of unqualified results was 75.38% with 24.62% qualified results. A total of 63 results were qualified due to method, preparation, or equipment blank contamination.

Based on the data validation performed for PFCs, 1,215 results were qualified (*e.g.*, "J," "JN," "R," "UB," or "UJ) due reason identified in the validation reports. The percentage of unqualified PFC results was 86.99% with 13.01% qualified results. A total of 21 results were qualified due to method, preparation, or equipment blank contamination.

$$\%\ \text{Usable Calculation}$$

$$= \frac{\text{Number of Usable Results (Results not Rejected)}}{\text{Total Number of Results}} \text{x}100$$

Summary of Data Qualifier Reasons

As a result of the data validation performed on the Bennington samples, Table 5 provides a summary of the reasons for qualification were observed by Environmental Standards. The top five qualifications applied to the analytical data were 1) reported positive results between the reporting limit and method detection limit, 2) laboratory duplicate imprecision, 3) high MS and/or MSD recoveries, 4) imprecision between the MS and MSD results, and 5) low MS and/or MSD recoveries.

Table 5: Reasons for Qualification and Percent Qualified

Reason Code	Definition	Percent Qualified
CI	Chromatographic Interference	0.029
CVH	CCV evaluation criteria not met, potential high bias	0.043
CVL	CCV evaluation criteria not met, potential low bias	0.201
EB	Equipment blank contamination	0.072
EC	Result exceeds the calibration range, potential bias indeterminate	.0172
FD	Field duplicate imprecision, potential bias indeterminate	1.207
HC	Holding time – collection to analysis, potential bias indeterminate	0.043
HCL	Holding time – collection to analysis, potential low bias	0.115
IS	Internal standard evaluation criteria not met, potential bias indeterminate	7.512
LAH	Laboratory control sample/laboratory control sample duplicate recovery criteria not met, potential high bias	0.144

Table 5: Reasons for Qualification and Percent Qualified		
Reason Code	Definition	Percent Qualified
LAL	Laboratory control sample/laboratory control sample duplicate recovery criteria not met, potential low bias	0.014
LD	Laboratory duplicate precision criteria not met, potential bias indeterminate	21.617
LP	LCS/LCSD precision criteria not met, potential bias indeterminate	0.129
MA	MS and/or MSD recovery criteria not met, potential bias indeterminate	0.460
MAH	MS and/or MSD recovery criteria not met, potential high bias	16.475
MAL	MA and/or MSD recovery criteria not met, potential low bias	7.555
MB	Method blank or preparation blank contamination	0.876
MP	MS/MSD precision criteria not met, potential bias indeterminate	9.897
PJ	Professional judgement, potential bias indeterminate	0.417
PMH	Performance evaluation mixture criteria not met, potential high bias	0.043
PML	Performance evaluation mixture criteria not met, potential low bias	0.029
PS	Low percent solids could affect accuracy, potential bias indeterminate	1.077
RL	The analysis meets all qualitative identification criteria, but the measured concentration is less than the quantitation or reporting limit, potential bias indeterminate	30.681
SD	Serial Dilution results did not meet evaluation criteria, potential bias indeterminate	0.948
SP	Sample preservation/cooler temperature, potential bias indeterminate	0.029
SPL	Sample preservation/cooler temperature, potential low bias	0.172
SRL	Surrogate recovery outside acceptance range, potential low bias	0.043

Table C.2.1
Level 2 Revisions Requested by Environmental Standards
CSM Site Investigation Report
Bennington, VT
Saint-Gobain Performance Plastics

SDG	Validation Level	Level 2 Revisions
SGB06	Level 2A/4	PFAS results for sample SG3-S42-170816 revised because an incorrect sample volume was used to calculate results (95.14 instead of 20 mL)
SGB07	Level 2A	Sample ID and collection date revised for one sample to match COC record
SGB15	Level 2A	Sodium and zinc were original reported from an analytical run with a contaminated method blank; results were re-reported from a compliant analysis.
SGB16	Level 2A/4	Revised due to ICP/MS data issue
SGB31	Level 2A	TOC method blank result(s) revised from 50,000 mg/kg to ND
SGB33	Level 2A/4	TOC method blank result(s) revised from 50,000 mg/kg to ND; TOC analysis times revised
SGB34	Level 2A/4	TOC method blank result(s) revised from 50,000 mg/kg to ND; TOC analysis times revised
SGB36	Level 2A/4	Revised to include boron
SGB37	Level 2A	TOC method blank result(s) revised from 50,000 mg/kg to ND
SGB41	Level 2A/4	Revised to include boron
SGB48	Level 2A/4	Revised to include boron
SGB49	Level 2A	Lab stated TOC analysis times of QC for sample times
SGB50	Level 2A	Lab stated TOC analysis times of QC for sample times
SGB51	Level 2A	Lab stated TOC analysis times of QC for sample times
SGB59	Level 2A/4	Revised to include boron
SGB61	Level 2A	Revised to add missing TOC laboratory duplicate and TOC case narrative
SGB74	Level 2A	Revision for sample IDs
SGB85	Level 2A	Revised for "B" flags missing for PFAS in one sample
SGB90	Level 2A	Lab stated TOC analysis times of QC for sample times
SGB95	Level 4	Lab stated TOC analysis times of QC for sample times
SGB96	Level 2A	Revised to remove state of NY references since VT state of origin
SGB97	Level 2A	Revised to remove state of NY references since VT state of origin
SGN01	Level 2A	Revised to add Bennington as the project
SNB01	Level 2A	Revised to correct boron from dissolved to total
SNB04	Level 2A	Revised to correct Sample ID
SNB11	Level 2A	Revised with updated sample receipt log (trip blanks not on COC)
SGB06	Level 2A/4	Revised to include boron
SNB17	Level 2A/4	Revised to correct boron from dissolved to total
SNB20	Level 2A/4	Revised to correct boron from dissolved to total

Technical Memorandum

To: File
From: Denise Levitan, Stephanie Theriault, and Michael Dupay
Subject: Statistical Evaluation: Soil
Date: December 7, 2017
Project: Saint-Gobain Performance Plastics CSM Site Investigation

Introduction

The purpose of the statistical evaluation on soil data collected within the investigation area was to determine what, if any, relationship exists between total organic carbon (TOC), metals, and per- and polyfluoroalkyl substances (PFAS) concentrations and evaluate any distributional relationships, such as spatial (depth or distance). These potential relationships may assist in further understanding the complexities of the PFAS fate and transport as well as identify potential alternative sources of PFAS to the investigation area. Results from this evaluation can then be used to further refine the Conceptual Site Model (CSM).

Methods

Two statistical software programs, ProUCL and R, were used to evaluate the data. ProUCL was primarily used to calculate summary statistics and R was used to assess the potential for statistically significant geochemical relationships observed between parameters and space. A more robust description of the methodologies used is included below.

Statistical Evaluation

A statistical evaluation of the groundwater data from the investigation was performed using ProUCL Version 5.1.002 software (U.S. EPA, 2016). ProUCL was specifically chosen for the evaluation due to its ability to properly account for datasets with a high proportion of non-detect concentrations.

Summary Statistics

The summary statistics calculated for the dataset include concentrations for minimum and maximum (i.e., the data range), a measure of central tendency (an average or alternate measure for datasets for which there may be limitations affecting calculations of averages), the total number of samples collected, and the percentage of values reported as non-detect. For the purposes of this analysis, data were divided into three groups: Bennington Landfill, non-landfill, and background. Soil samples from the shallow soil borings were analyzed for PFAS, TOC, soil pH, and moisture content. At the request of the Vermont Department of Environmental Conservation (VTDEC), soil samples from the deep soil borings and bedrock monitoring wells were also analyzed for target-analyte-list (TAL) metals/cations.

The measure of central tendency for each parameter-group pair was determined using the decision process outlined in Table 1 below. These decisions are based on regulatory technical documents, including the U.S. EPA's Statistical Analysis of Groundwater Monitoring Data at RCRA Facilities (Unified Guidance; U.S. EPA, 2009), the ProUCL Version 5.1.002 Technical Guide: Statistical Software for Environmental Applications for Data Sets with and without Nondetect Observations (ProUCL Technical

DRAFT

Guide; U.S. EPA, 2015), and the ITRC Guidance Document: Groundwater Statistics and Monitoring Compliance (ITRC Guidance; ITRC, 2013). Additionally, for the purpose of this analysis, non-detects were included in the calculation of the measure of central tendency at the detection limit.

The calculation of a measure of central tendency and range of the data is a first step in the assessment of whether the geographically diverse investigation area is geochemically diverse as well. In order to assess whether the area is geochemically diverse and thus to develop an understanding of geochemical relationships for PFAS, statistical summaries, including an overall measure of central tendency, are presented in order to look at overall data spread. Further analysis reevaluates the data when classified by locational groups, such as locations near known surface activities like the Bennington Landfill or different depth levels, that may cluster near or far (numerically) from the center. More focused geographical results are discussed later in this Appendix.

Table 1 Summary of Non-Substitution Approaches for Measures of Central Tendency

Sample Size	Non-Detect Frequency	Measure of Central Tendency	Citations
All	0%	Arithmetic mean	For datasets with no non-detects, the Kaplan-Meier mean is equal to the arithmetic mean (Helsel, 2012).
	≤50%	Kaplan-Meier mean	• Kaplan Meier recommended (U.S. EPA, 2009 pg. 15-3) *"The guidance generally favors the use of the …Kaplan-Meier or Robust ROS* [regression on order statistics] *methods which can address the problem of multiple detection limits."* • Robust ROS ruled out (U.S. EPA, 2009 pg. 8-24) Robust ROS underlying assumptions: *"Data must be normal or normalized…"* • Limit at 50% non-detects (U.S. EPA, 2009 pg. 8-23) *"Kaplan-Meier should not be used when more than 50% of the data are non-detects."*
	>51%	Median value. If median is a non-detect, report as a less-than value.	• Site-specific method (U.S. EPA, 2015 sec. 1.12): *"For data sets with low detection frequencies, other measures such as the median or mode represent better estimates (with lesser uncertainty) of the population measure of central tendency."*
	100%	Not reported (n/a)	For datasets with no detected data, no measure of central tendency will be reported.

Geochemical Statistical Evaluations

For the purposes of this assessment, the soil statistical evaluation was limited to select parameters, including the 14 PFAS parameters, 22 metals, TOC, pH, and moisture content. Table 2 lists these parameters as well as the total number of samples evaluated and the number and percentage of those with concentrations below the detection limit. The soil statistical evaluation includes 147 samples collected from shallow soils sampling conducted in March-May 2016 by C.T. Male (C.T. Male, 2016) and 568 samples collected as part of this CSM Field Investigation.

Table 2 List of Parameters Included in Statistical Analyses

Parameter	#Samples	#Non-Detects	%Non-Detects
Aluminum	301	0	0%
Antimony	301	61	20%
Arsenic	301	0	0%
Barium	301	0	0%
Beryllium	301	0	0%
Cadmium	301	8	3%
Calcium	301	1	0%
Carbon, total organic	715	47	7%
Chromium	301	0	0%
Cobalt	301	0	0%
Copper	301	0	0%
Iron	301	0	0%
Lead	301	0	0%
Magnesium	301	0	0%
Manganese	301	0	0%
Moisture	717	0	0%
Nickel	301	0	0%
Perfluorobutane sulfonate (PFBS)	715	714	100%
Perfluorobutanoic acid (PFBA)	568	506	89%
Perfluorodecanoic acid (PFDA)	715	622	87%
Perfluorododecanoic acid (PFDoA / PFDoDA)	715	671	94%
Perfluoroheptanoic acid (PFHpA)	715	684	96%
Perfluorohexane sulfonate (PFHxS)	715	715	100%
Perfluorohexanoic acid (PFHxA)	715	652	91%
Perfluorononanoic acid (PFNA)	715	601	84%
Perfluorooctane sulfonate (PFOS)	715	573	80%
Perfluorooctanoic acid (PFOA)	715	369	52%
Perfluoropentanoic acid (PFPeA)	568	562	99%
Perfluorotetradecanoic acid (PFTA / PFTeDA / PFTeA)	715	683	96%
Perfluorotridecanoic acid (PFTrDA / PFTriA)	715	691	97%
Perfluoroundecanoic acid (PFUnA / PFUnDA)	715	655	92%
pH	566	0	0%
Potassium	301	0	0%
Selenium	301	66	22%
Silver	301	98	33%
Sodium	301	65	22%
Thallium	301	8	3%
Vanadium	301	0	0%
Zinc	301	0	0%

DRAFT

Although the soil samples were analyzed for a number of parameters, this statistical analysis primarily focused on evaluating the differences in concentrations of PFAS and metals among groupings thought to potentially impact attenuation in soils and on correlative relationships between parameters. The following potential correlations were evaluated:

- Spatial Correlations – Parameter-Depth: surface (0 to 1.5 feet below ground surface [bgs]), shallow (1.5 to 5.0 feet bgs), and deep (greater than 5 feet bgs);
- Spatial Correlations – Parameter-Distance: distance from the former Water Street Facility and geographic area (background, landfill, and non-landfill); and
- Parameter-Parameter: TOC, PFOA, and selected metals (calcium and iron were selected as potentially representative non-transition and transition metals, respectively, and as metals that have been observed in other studies to potentially impact PFAS behavior in soils [Ferrey et al., 2012]);

Several visual and statistical evaluation tools, including box-and-whisker plots, scatter plots, and analysis of variance (ANOVA), were utilized to evaluate parameter-spatial correlations, whereas parameter-parameter correlations were evaluated using monotonic trend analysis. Initial evaluations indicated a positive and statistically significant relationship between PFOA and TOC. Therefore, the analyses described above were also conducted on PFOA concentrations normalized to TOC. These analyses were conducted using the R statistical environment (R Core Team, 2017).

Visual Evaluation: Box-and-Whisker and Scatter Plots

Two types of plots were produced to initially visualize the large amount of data: box-and-whisker plots and scatter (x-y) plots. Box-and-whisker plots visually illustrate the spread of a dataset and can be used to discern group differences. Scatter (x-y) plots show the relative variation between two variables.

Box-and-whisker plots consist of a central box, with the lower limit of the box indicating the first quartile (25th percentile of the data) and the upper limit of the box indicating the third quartile (75th percentile of the data). The height of the box (the difference between the first and third quartiles) is called the interquartile range. Within the box is a heavy line indicating the median (50th percentile of the data). Extending in each direction from the box are "whiskers," which extend to values within one and a half times the interquartile range from each end of the box. Values beyond the whiskers are potential outliers.

Because the range of measured values for most parameters in this investigation spanned one or more orders of magnitude, logarithmic axes were used for parameters other than pH. Symbol color and/or shape were used to distinguish values below detection limits from detected values and to differentiate by sample collection location. Except as otherwise noted, values below detection limits were plotted at the detection limit and were included in plot computations, such as box-and-whisker plot quartiles.

Analysis of Variance

The non-parametric ANOVA Kruskal-Wallis test was used to assess whether statistically significant differences existed among distance and depth groupings. For parameters with >15% non-detects, all values below the highest detection limit were reset as 0 for the test (Helsel, 2012). An alpha of 0.002 (based on a Bonferroni correction) was used to assess the significance of the results.

DRAFT

If the Kruskal-Wallis test indicated statistical significance, a post-hoc Dunn test was conducted to assess between-group differences. The Holm correction was used to control for family-wide error rate in these tests (Gardener, 2017).

Monotonic Trend Analysis

Correlations between parameters were assessed using Kendall's tau for monotonic trend. Kendall's tau is a non-parametric statistical test used to assess whether two parameters systematically increase (significant positive correlation) or decrease (significant negative correlation) together, but it does not require the change to follow a specific pattern (e.g., linear).

TOC Normalized Analysis

The conceptual modeling described in the Draft CSM Report (Barr, 2017) used TOC concentrations to characterize PFOA retention in soils. Appendix D.2 identified a background PFOA:TOC ratio of 0.0586 ng PFOA/mg TOC and calculated a background PFOA soil concentration of about 1.46 ng PFOA/g soil (assuming a TOC concentration of 25,000 mg/kg). The distribution of PFOA concentrations normalized to TOC concentrations was analyzed using several of the univariate methods described above; correlations with metals parameters and distances from the former Water Street facility and from Bennington Landfill were evaluated. Due to the variability in PFOA detection limits, calculations involving the PFOA to TOC ratio included only samples for which PFOA concentrations were above the detection limit.

Multivariate Analysis

Agglomerative hierarchical clustering (AHC) analysis was previously conducted on PFAS in groundwater (Barr, 2017). Complimentary AHC analysis was attempted for PFAS in soil. However, the high proportion of non-detect samples for PFAS other than PFOA limited the coverage of the analysis. Preliminary AHC results did not yield meaningfully interpretable results with the potential to indicate distinct signatures for potential sources or areas. Thus, AHC was not included in the soil statistical analysis.

Results

Summary Statistics

Calculated summary statistics are included in Table 3 (attached), and associated ProUCL outputs are included in Attachment A.

Geochemical Statistical Evaluations

TOC and PFAS

Box-and-whisker plots of PFAS concentrations grouped by depth levels are presented in Figure 1. These plots show that the surface soils (0-1.5 feet bgs) generally contain a higher proportion of detected PFAS relative to shallow (1.5-5 feet bgs) and, particularly, deep (greater than 5 feet bgs) soils. Among the PFAS with the greatest number of detected measurements (PFNA, PFOS, and PFOA), the median concentrations of these PFAS in the surface soils are greater than those in the shallow and deep soils. Box-and-whisker plots of PFAS concentrations grouped by location are shown on Figure 2. On this figure, the boxes labeled "Other" represent non-landfill samples. The spread of these data, as indicated by the interquartile range, is larger than for samples from the landfill. However, samples from the four background locations have a similar spread in TOC and PFOA concentrations.

DRAFT

As previously indicated, concentrations were evaluated at different locations and depths. Depth-related ANOVA results indicate that the difference in TOC and PFOA concentrations among depth groupings was statistically significant (based on the reported p-value), when assessed using the Kruskal-Wallis test (Table 4). A reported p-value of less than 0.002 in the Kruskal-Wallis test, and less than 0.05 with the Holm correction in the Dunn test, is considered statistically significant (i.e., a statistically significant difference between the compared groups exists). For TOC, all three depth classifications were statistically significantly different from one another. For PFOA, surface and shallow soil concentrations were not significantly different from each other, but both were statistically significantly different from deep soils.

As for ANOVA results among the three locations (background, landfill, and non-landfill), TOC concentrations were significantly different between landfill and non-landfill, but PFOA concentrations were statistically significantly different between background and landfill as well as non-landfill and landfill. Conversely, PFOA concentrations were not statistically significantly different between background and non-landfill, and TOC concentrations were not significantly different between background and either non-landfill or landfill (Table 4).

DRAFT

Parameter	Kruskal-Wallis Test Results		Post-Hoc Dunn Test Results for Depth Groupings		
	Depth	Location	Deep-Shallow	Deep-Surface	Shallow-Surface
Zinc	0.349	0.029	NA	NA	NA

Values in **bold** indicate significant p-values. A p-value is considered significant if less than 0.002 in the Kruskal-Wallis test and less than 0.05 with the Holm correction in the Dunn test.
NA indicates that a post-hoc Dunn test was not conducted because the result of the Kruskal-Wallis test was not statistically significant.
Results from location Dunn tests not shown. Dunn tests for location were conducted only for TOC, PFOA, and pH, as metals were not evaluated at background locations.

Metals

Box-and-whisker plots of metals grouped by depth are shown on Figure 3. For most constituents, the overall data spread was similar among depth classes. Most parameters also did not exhibit statistically significant differences between surface and shallow soil samples and between shallow and deep soil samples. However, most parameters had statistically significant concentration differences between surface and deep soil samples (Table 4).

Metals were not measured in the four background samples and therefore were not included in the statistical evaluation. However, pH of the background samples was measured and differed significantly among the location groups; background was statistically significantly different from both landfill and non-landfill samples, but landfill and non-landfill samples were not statistically significantly different. The most distinct (statistically significant) differences were seen in major non-transition metals (calcium, magnesium, potassium, and sodium) as well as aluminum, chromium, and thallium (Table 4).

Monotonic Trend Analysis

Based on the results of the monotonic trend analysis, TOC and PFOA were positively correlated across the investigation area. The only other parameter with which PFOA showed a statistically significant positive correlation was silver. PFOA was negatively correlated with pH, which may be indicative of the effect pH, in addition to TOC, has on a soil's ability to retain PFAS (Ferrey et al., 2012). Calcium and iron were correlated with a number of other metals and with TOC, but these correlations were generally opposite (i.e., a negative correlation with calcium corresponded with a positive correlation with iron), likely indicative of different soil composition types.

In terms of distance from the former Water Street facility, PFOA decreased significantly with increasing distance and, as previously noted, with depth. Other parameters, such as aluminum, chromium, magnesium, potassium, sodium, and vanadium, had similar negative correlation relationships with increasing distance from the former Water Street facility.

Correlation coefficients are presented in Table 5. Scatter plots illustrating the relationships between TOC and PFAS and PFOA and various inorganic constituents are shown on Figure 4 and Figure 5, respectively.

Zinc	-0.070	0.143	**-0.223**	-0.144	**0.598**	-0.193	0.104

Values in **bold** indicate statistically significant correlations
More saturated green shading indicates stronger positive correlations; more saturated blue indicates stronger negative correlations.

Spatial Distribution

As noted, the distance from the former Water Street facility was significantly negatively correlated with several parameters, meaning that these parameters decreased with increasing distance from the facility. Additionally, all of these parameters were statistically significantly different between landfill and non-landfill areas. Thus, it is possible that the high number of soil samples taken from the landfill (232 total landfill samples, 467 non-landfill samples, 18 background samples) may have biased the results of the monotonic trend analysis.

Figure 6 shows concentrations of PFAS and other parameters in surface soil with distance from the former Water Street facility. For several PFAS compounds, detected concentrations decreased with increasing distance from the facility. However, concentrations also generally showed a spike within landfill samples.

PFOA:TOC Ratio

Figure 7 shows plots of PFOA:TOC and PFOA with distance from the former Water Street facility and from Bennington Landfill. These plots include linear trend lines based on detected values from landfill and non-landfill samples. The regional background values identified in Appendix D.2 are plotted as dashed orange

DRAFT

lines. Both the PFOA:TOC and PFOA trends decreased with distance from the former Water Street facility and increased with distance from Bennington Landfill. The trend was stronger for distance away from the former Water Street Facility compared to distance away from Bennington Landfill for both PFOA:TOC and PFOA. In addition, the trend was stronger for PFOA:TOC than for PFOA alone. The stronger trend associated with the PFOA:TOC ratio compared with PFOA alone substantiates the use of TOC in evaluating soil PFOA concentrations in the investigation area.

Figure 8 shows box-and-whisker plots of PFOA concentrations and PFOA:TOC ratios for surface samples divided by area and for all samples divided by depth level. When only PFOA concentrations are considered, landfill samples are significantly different from both background and non-landfill samples, and deep samples are significantly different from shallow and surface samples. However, when PFOA concentrations are normalized to TOC concentrations, landfill samples are significantly different from only non-landfill samples, and deep samples are not significantly different from either shallow or surface samples, though the ratios in shallow and surface samples are significantly different from each other. These post-hoc significance groupings are indicated on Figure 8 by lettering statistically significant groupings as "a" or "b" and overlapping groupings as "ab." PFOA concentrations below detection limits are included in Figure 8 for PFOA concentrations but not for ratios; the among-group analysis remains true even when non-detect PFOA concentrations are not considered. These results further suggest that TOC is a factor in controlling soil PFOA concentrations.

Figure 9 and Table 6 show the relationship of the PFOA:TOC ratio to other parameters. Generally, the PFOA:TOC ratio exhibited similar but inverse correlations as TOC, with which it was significantly negatively correlated, although it was also significantly negatively correlated with distance from the former Water Street facility. These results suggest that the overall amount of TOC may be responsible for more of the data variation than PFOA.

DRAFT

Table 6 Results of Kendall's Tau Correlation Evaluation for PFOA:TOC Ratio

Values in **bold** indicate statistically significant correlations.
Correlation assessed including only samples with detected PFOA concentrations.

DRAFT

Summary

Soil concentrations of the parameters assessed in this report were variable throughout the investigation area.

The concentration of a number of parameters varied significantly with soil depth. Organic parameters (PFAS and TOC) and several major non-transition metals (calcium, magnesium) were notably higher in concentration in the surface soils than in the deep soils, whereas iron and trace metals (such as copper and nickel) increased in concentration with depth. The higher concentration of PFAS in surface soils relative to deep soils is consistent with atmospheric deposition and/or infiltration from the surface. The

higher concentrations of organic carbon at the surface are consistent with a soil weathering profile (Langmuir, 1997).

Different sections of the investigation area had different geochemical patterns. Although there was a decreasing trend in PFOA and in PFOA:TOC with increasing distance from the former Water Street facility, PFOA concentration was not significantly different between non-landfill samples and background. In addition, the median PFOA concentration was statistically significantly higher in the non-landfill samples than in landfill samples, but the highest PFOA concentrations were found in soils from the landfill. These results suggest that some surface activities (such as those at the landfill) may lead to highly localized variations in soil chemistry that have the potential to confound interpretation of larger-scale patterns.

Interactions between parameters in soil samples also appear to account for some of the observed concentration variability. For example, pH and PFOA are significantly negatively correlated. This relationship may be due to a lesser ability of acidic soils to sorb or otherwise retain PFAS. The significant correlation between PFOA and TOC likely indicates both a better retention of PFAS by organic material and the higher concentrations of both at shallower depths (Ferrey et al., 2012). However, a spatial trend emerges more strongly when PFOA is normalized to TOC. This relationship suggests that evaluating these parameters together, as done in the CSM, can assist in interpretation of chemical variability in the investigation area.

Technical Memorandum

To: File
From: Stephanie Theriault
Subject: Statistical Evaluation: Groundwater
Date: November 20, 2017
Project: Saint-Gobain Performance Plastics CSM Site Investigation

Introduction

Groundwater quality data collected as part of the CSM site investigation were evaluated to determine what, if any, differences (or similarities) exist between water quality at Bennington Landfill (landfill) and water quality elsewhere in the investigation area (non-landfill). Water samples were collected from permanent and temporary monitoring wells that were installed as 25 locations and six previously existing landfill monitoring wells. One sample from the landfill leachate vault was collected and evaluated as part of the groundwater analytical results. Of the temporary and permanent monitoring well samples, 15 were collected at locations outside of the landfill, 15 at the landfill, and one at a background location. *Additional samples will be collected from bedrock wells being constructed as part of this investigation at or near the landfill and this memorandum will be updated to include these results.*

The primary analyses of the groundwater quality data included a groundwater-type analysis (using major cation and anion concentrations) and a statistical evaluation consisting of calculation of summary statistics, box-and-whisker data plotting, and analysis of variance (ANOVA) testing. The evaluation was conducted on the two groups of data (representing landfill and non-landfill areas), with focus on PFOA and PFOS concentrations. For the purposes of this investigation, comparisons were not made to background groundwater quality or the leachate vault as only one sample of each was available at the time of evaluation. The methodology and results of the analyses are discussed below.

Methods

Water Type Analysis

In order to determine the "type" of groundwater a sample represents, relative concentrations of major cation and anions are plotted on Stiff and Piper diagrams. Stiff diagrams are plots presenting water chemistry as shapes reflecting the geochemical signature of the water sample and allowing for a visual comparison of water types between samples. Piper diagrams are plots of major ion chemistry that are used to differentiate between water types, and to identify potential mixing of water types (Helsel and Hirsch, 2002). The comparisons of water type provided by Stiff and Piper plots can be used to evaluate spatial differences in water chemistry (depth and/or distance).

Statistical Evaluation

A statistical evaluation of the groundwater data from the investigation was performed using ProUCL Version 5.1.002 software (U.S. EPA, 2016). ProUCL was specifically chosen for the evaluation due to its ability to properly account for datasets with a high proportion of non-detect concentrations.

DRAFT

Summary Statistics

The summary statistics calculated for the dataset include concentrations for minimum, maximum, a measure of central tendency (an average or alternate measure for datasets for which there may be limitations affecting calculations of averages), the total number of samples collected, and the percentage of values reported as non-detect. For the purposes of this analysis, data were divided into three groups: Bennington Landfill, non-landfill, and background. The background group contains only one sample. The parameters analyzed include PFAS, target-analyte-list (TAL) metals/cations (including cyanide and mercury), anions, ammonia, orthophosphate, total Kjeldahl nitrogen, 1,4-dioxane, and VOCs. Not all of these parameters were analyzed for all samples.

The measure of central tendency for each parameter-group pair was determined using the decision process outlined in Table 1 below. These decisions are based on regulatory technical documents, including the EPA's Statistical Analysis of Groundwater Monitoring Data at RCRA Facilities (Unified Guidance; U.S. EPA, 2009), the ProUCL Version 5.1.002 Technical Guide: Statistical Software for Environmental Applications for Data Sets with and without Non-detect Observations (ProUCL Technical Guide; U.S. EPA, 2015), and the ITRC Guidance Document: Groundwater Statistics and Monitoring Compliance (ITRC Guidance; ITRC, 2013). Additionally, for the purpose of this analysis, non-detects were included in the calculation of the measure of central tendency at the detection limit.

Table 1 Summary of Non-Substitution Approaches for Measures of Central Tendency

Sample Size	Non-Detect Frequency	Measure of Central Tendency	Citations
All	0%	Arithmetic mean	For datasets with no non-detects, the Kaplan-Meier mean is equal to the arithmetic mean (Helsel, 2012).
	≤50%	Kaplan-Meier (KM) mean	• Kaplan Meier recommended (U.S. EPA 2009, pg. 15-3) *"The guidance generally favors the use of the …Kaplan-Meier or Robust ROS* [regression on order statistics] *methods which can address the problem of multiple detection limits"* • Robust ROS ruled out (U.S. EPA 2009, pg. 8-24) Robust ROS underlying assumptions: *"Data must be normal or normalized…"* • Limit at 50% non-detects (U.S. EPA 2009, pg. 8-23) *"Kaplan-Meier should not be used when more than 50% of the data are non-detects."*
	>51%	Median value. If median is a non-detect, report as a less-than value	• Site-specific method (U.S. EPA 2015, sec. 1.12): *"For data sets with low detection frequencies, other measures such as the median or mode represent better estimates (with lesser uncertainty) of the population measure of central tendency."*
	100%	Not reported (n/a)	For datasets with no detected data, no measure of central tendency will be reported.

Box-and-Whisker Plots

Box-and-whisker plots were created for the PFAS compounds. These plots visually illustrate the spread of a dataset and can be used to discern group differences. Box-and-whisker plots consist of a central box, with the lower limit of the box indicating the first quartile (25th percentile of the data) and the upper limit

DRAFT

of the box indicating the third quartile (75th percentile of the data). The height of the box (the difference between the first and third quartiles) is called the interquartile range. Within the box is a heavy line indicating the median (50th percentile of the data). Extending in each direction from the box are "whiskers," which extend to values within one and a half times the interquartile range from each end of the box. Values beyond the whiskers are potential outliers.

ANOVA

The non-parametric ANOVA Tarone-Ware Test was used to assess whether statistically significant differences existed among groupings. An alpha value of 0.05 was used to assess the significance of the results. The Tarone-Ware Test is appropriate for datasets that are not normally distributed and contain non-detects (U.S. EPA, 2015). This test was used to determine if the PFOA and PFOS median concentrations at the Bennington Landfill are less than or equal to the median concentrations within the non-landfill samples.

Results

Groundwater Type

Based on the results of the Piper diagrams (Figure 1), the majority of the groundwater samples collected at Bennington Landfill and outside of the landfill are characterized as calcium-bicarbonate type water. The background sample (BG4) is also a calcium-bicarbonate type water. This suggests that most of the groundwater samples collected from the unconsolidated material were collected from a chemically similar source, such as the same aquifer. Notable exceptions are non-landfill samples D03 (calcium-chloride type), S08 (mixed), and S49 (sodium-chloride type), and landfill samples S28 and B-2-2 (both sodium-chloride). D03 and S08 are both located along the northern edge of Corrective Action Area II (CAAII) and S49 is the farthest south groundwater sample, located just outside of the southern edge of CAAII along a stream. Additionally, S28 is the easternmost sample collected at the landfill, located along Hewitt Brook; B-2-2 is also east of the landfill, south of the leachate collection system. The leachate sample, although not a groundwater sample, is characterized as a sodium-bicarbonate type.

The Stiff diagrams (Figure 2) for the groundwater samples also support these water-type characterizations; the majority of the samples display a similar shape except for the five outliers (D03, S08, S28, S49, and B-2-2) and the leachate vault.

[A discussion of landfill bedrock groundwater Stiff and Piper results, including B-4-3, will be included here.]

Statistical Evaluation

Summary Statistics

A large proportion of the PFAS compounds were non-detect (i.e., below quantifiable laboratory detection limits). Only two PFAS compounds were detected in the background sample (BR4): perfluoroheptanoic acid (PFHpA) at 0.9 ng/L and PFOA at 6 ng/L. Outside of the Bennington Landfill, PFOS concentrations ranged from non-detect (<0.8) to 23 ng/L at S03 and PFOA concentrations ranged from 5 to 850 ng/L at S34. S03 is located beyond the northern boundary of CAAII, within the Town of Shaftsbury. S34 is located on the eastern side of Corrective Action Area I (CAAI), along the Walloomsac River, just north of VT 279.

DRAFT

Based on the proportion of non-detect results in samples collected outside of the landfill, the measure of central tendency for PFOS is 4.7 ng/L (KM mean) and for PFOA is 129.9 ng/L (arithmetic mean).

Within Bennington Landfill, PFOS concentrations in groundwater samples ranged from non-detect (<0.7) to 12 ng/L and PFOA concentrations ranged from 3 to 160 ng/L. The highest concentration of PFOS in a groundwater sample from the landfill area was at S28 (12 ng/L), which is east of the landfill near Hewitt Brook. The highest concentrations of PFOA in groundwater samples from the landfill was at SG3-MW17-01 (160 ng/L), which is located downgradient (east) of the leachate vault. The concentrations of PFOS and PFOA in the leachate vault were 35 and 4,700 ng/L, respectively. Based on the proportion of non-detect results in samples collected in the landfill, the measure of central tendency for PFOS is 4.7 ng/L (KM mean) and for PFOA is 62.9 ng/L (arithmetic mean). Results of the summary statistics are in Table 2. Associated ProUCL outputs are included in Attachment A. [Discuss landfill bedrock groundwater summary stats]

Box-and-Whisker Plots

Box-and-whisker plots of PFAS concentrations grouped by location are shown on Figure 3. No differences between Bennington Landfill and non-landfill samples for the PFAS compounds are apparent on these plots.

ANOVA

The mean PFOS concentration of the samples collected at Bennington Landfill as well as outside of the landfill, were both 4.7 ng/L. An ANOVA test conducted on those two groups found no statistically significant difference. ANOVA testing was also conducted on PFOA concentrations between those same groups and, despite the different mean concentrations, there is no statistically significant difference between the samples collected outside of the landfill and groundwater samples collected from monitoring wells located at the landfill. ANOVA results are included in Attachment B.

Summary

The majority of groundwater samples collected across the investigation area are characterized as calcium-bicarbonate type water, except for a few samples collected along the edges of the investigation area. These results suggest that the water samples were collected from a chemically similar source of water, such as the same aquifer.

The distributions of PFOS and PFOA concentrations were similar between Bennington Landfill and non-landfill locations, despite relatively large differences in individual PFOA concentrations. For PFOS, the highest groundwater concentrations measured were located along the outer edges of the investigation areas, with concentrations greater than 10 ng/L at S03 (north; non-landfill), S41 (south; non-landfill), and S28 (east; Bennington Landfill).

Technical Memorandum

To: File
From: Charles Gantzer
Subject: Background PFOA in Soil
Date: December 12, 2017
Project: 45/02-1004

DRAFT

Summary

A representative background perfluorooctantoic acid (PFOA) soil concentration was developed for purposes of this report from an analysis of the investigation's soil data. The background concentration provides context for interpreting the results from a fate and transport model for PFOA in the vicinity of the former Chemfab facilities (Barr, 2017). The model uses a total organic carbon (TOC) concentration of 25,000 mg TOC/kg soil (2.5 percent by weight) to characterize the retention of PFOA in surficial soil. Thus, for purposes of this report, the objective was to define the background PFOA concentration associated with a TOC of 25,000 mg/kg. Background composite soil samples were collected from four locations north and east of Bennington, VT. Three of the four locations had composite PFOA/TOC ratios within the range expected for background soils, based on the distribution of PFOA/TOC values reported for 33 North American soil samples. The average PFOA/TOC ratio for the soil samples collected at the three background locations was 0.0586 ng PFOA/mg TOC. For an assumed TOC concentration of 25,000 mg/kg, the calculated background PFOA soil concentration is about 1.46 ng PFOA/g soil.

Introduction

Several regional and local factors influence background PFOA concentrations in surficial soils. These include the long-range atmospheric gas and particulate transport of PFOA and its precursors (Ellis *et al.*, 2004; Barton *et al.*, 2010), dry and wet deposition of PFOA and its salts onto soil surfaces (Strynar *et al.*, 2012; Xiao *et al.*, 2015), precipitation infiltration to carry the water-soluble PFOA salts into the soil (Rankin *et al.*, 2016), and the retention of the PFOA salts by the soil column (Zareitalabad *et al.* 2013). Thus, two spatially-close sampling locations experiencing comparable PFOA deposition rates due to long-range transport could have significantly different soil PFOA concentrations, because of differing water infiltration rates, PFOA retention factors, or both. A regionally constant background PFOA soil concentration should not be expected. The thought is that normalizing observed background soil PFOA concentrations to soil TOC concentrations should reduce the site-specific variability, assuming similar deposition and infiltration rates.

A background soil concentration of PFOA was developed for Bennington, VT. The developed background concentration was normalized to the soil conditions assumed in the PFOA fate and transport model, *i.e.*, a surficial soil TOC concentration of 25,000 mg organic carbon per kg soil (dry weight) (Barr, 2017). Soil samples were collected at four locations expected to represent background concentrations north and east of Bennington (Figure 1). The locations ranged from approximately 8 to 22 miles from the former Chemfab facility on Water Street. Analysis included PFOA and TOC concentrations. The average PFOA/TOC values for the four sampling locations were compared to

reported North American background PFOA/TOC values to assess whether the four locations were representative of known background conditions. After this assessment, a background PFOA concentration associated with a TOC of 25,000 mg/kg was calculated.

North American Background PFOA Soil Concentrations

Rankin *et al* (2016) sampled 33 locations in North America for background PFOA concentrations in surficial soil. As shown in Figure 2, the median (50th percentile) background PFOA concentration was about 0.347 ng/g and the concentration corresponding to the 95th percentile was about 1.930 ng/g. One of the 33 sampling sites was located near Holderness, NH and was named station NA17. This sampling location is a distance of approximately 100 miles from the Bennington area.

As shown on Figure 2, the surficial soil sample NA17 had a PFOA concentration of 1.249 ng/g, which corresponds to a cumulative frequency of about 89 percent. The NA17 soil sample was from a forested area in New England and had one of the highest background PFOA concentrations. There is no indication whether the NA17 site was located near a cross-country skiing area. Use of fluorinated cross-country ski wax can result in locally elevated soil PFOA concentrations along ski trails (Plassmann and Berger, 2013).

The PFOA/TOC cumulative frequency distribution for the 33 North American soil samples is provided in Figure 3. The median ratio value is 0.0113 ng PFOA/mg TOC and the 95th percentile is 0.124 ng PFOA/mg TOC. The background soil sample collected from near Holderness, NH had a PFOA/TOC value of 0.0115 ng/mg and is approximately equal to the calculated median value. The Holderness, NH sample (NA17) had a reported TOC concentration of 108,500 mg TOC/kg soil (Rankin *et al*., 2016).

Bennington Background PFOA Soil Concentrations

Background surficial soil samples were collected at four locations north and east of Bennington, VT. The four locations are shown on Figure 1. At each location, soil samples were collected across depths ending at 6 inches, 12 inches, and 18 inches below the soil surface. Four of the twelve individual background soil samples had PFOA concentrations less than the Method Detection Limit (MDL) and their concentration was assumed to equal the MDL for purposes of this analysis. The arithmetic average PFOA and TOC concentrations of the three samples obtained from each background location are provided in Table 1. The resulting composite averages for PFOA ranged from 0.210 ng/g at BG3 to 3.733 ng/g at BG2.

Figure 2 compares the average PFOA concentrations for the four background locations to the cumulative frequency distribution for the 33 North American background soil samples. Two of the background samples (BG1 and BG2) had PFOA concentrations greater than the Holderness, NH sampling location (NA17), one background sample (BG4) had a PFOA concentration equal to that of NA17, and the fourth background sample (BG3) had a concentration less than that of NA17.

DRAFT

Because soil TOC has been identified as a factor that influences the retention of PFOA in soils both in the analysis of the CSM Site Investigation data (Appendix D.1a) and in the literature (e.g., Zareitalabad *et al*. 2013), soil PFOA concentrations were normalized to the soil TOC concentration. The calculated PFOA/TOC ratios for the background soil locations are provided in Table 1 and range from 0.0435 to 0.5518 ng PFOA/mg TOC.

Table 1 Average PFOA, TOC, and PFOA/TOC ratios for the Bennington background soil samples from the upper 1.5 feet collected at the four soil sampling locations provided in Figure 1.

Sample Location	Average PFOA (ng/g)	Average TOC (mg/kg)	Average PFOA/TOC (ng PFOA/mg TOC)*
BG1	1.99	5,600	0.5518
BG2	3.73	47,800	0.0709
BG3	0.21	5,560	0.0435
BG4	1.25	18,100	0.0616

* the listed Average PFOA/TOC values were obtained by individually determining the PFOA/TOC value for each of the three soil samples collected at each location and then calculating the average

Figure 3 compares the average PFOA/TOC ratios for the four Bennington background locations to the cumulative frequency distribution for the 33 North American background soil samples. All four background samples have PFOA/TOC ratios greater than the median value for the 33 North American background soil samples. With the exception of background sample BG1, the Bennington background samples have PFOA/TOC ratios less than the 95th percentile value of 0.124 ng PFOA/mg TOC for the 33 North American background soil samples. For purposes of this report, the 95th percentile PFOA/TOC value is assumed to represent the upper limit for considering a soil sample as part of the same population as the 33 North American background samples. The three background composite soil samples BG2, BG3, and BG4 are considered to be representative background soil samples for North America. The average PFOA/TOC for the three background locations is 0.0586 ng PFOA/mg TOC with a standard deviation of 0.0293 ng PFOA/mg TOC.

Background PFOA Soil Concentration for Fate and Transport Modeling

The fate and transport model characterizes the retention of PFOA in surficial soils based on a TOC concentration of 25,000 mg TOC/kg soil (Barr 2017). The above calculations suggest that PFOA/TOC ratio for background Bennington soils is about 0.0586 ng PFOA/mg TOC, which is within the range of expected PFOA/TOC values for background North American soils. Multiplying the TOC concentration by the background PFOA/TOC ratio yields a background PFOA soil concentration of 1.46 ng PFOA/g soil. Thus, a reasonable background PFAO soil concentration for use in the fate and transport model is about 1.46 ng PFOA/g soil.

Bedrock Desktop Review and Outcrop Study Report

DRAFT

December 14, 2017 Project No.: 177-8327

RE: OUTCROP MAPPING AND AIR PHOTO LINEAMENT ANALYSIS
SAINT-GOBAIN PERFORMANCE PLASTICS
BENNINGTON, VERMONT
VT DEC SITE #199712055

Golder Associates Inc. (Golder), on behalf of Saint-Gobain Performance Plastics (Saint-Gobain), conducted outcrop field geologic mapping and an aerial photograph lineament analysis of the area surrounding the Bennington Landfill, in Bennington, Vermont. The field mapping and lineament analysis was conducted to:

- Verify 2017 Vermont Agency of Natural Resources (VTANR) geologic mapping of the area
- Collect geologic, hydrogeologic and rock mass discontinuity data at the outcrop-level scale
- Collect lineament trend data at a larger scale

Because groundwater flow within the bedrock can be influenced by the nature and orientation of bedrock fractures, which form a secondary porosity, information obtained during this study can be used to assist in future studies of the landfill area and to aid in the siting of monitoring wells, as necessary.

The following sections provide a regional geologic summary, describe the study methods used and summarize the findings.

1.0 REGIONAL GEOLOGIC SUMMARY

The Bennington Landfill (the Site) is located approximately 2.5 miles north of the town of Bennington, in the southwestern corner of Vermont. The Site is located within the Central Vermont Valley physiographic province, lying within the north-south trending topographic belt known as the Vermont Valley, bounded by the Green Mountain Massif to the east and the Taconic Range to the west. The Taconic Range is underlain by metamorphosed Cambrian and Ordovician sedimentary rocks, consisting of slate and phyllite. The Green Mountains are underlain by very resistant Precambrian and Cambrian granite, syenite, gneiss and quartzite. The Vermont Valley is underlain by relatively less resistant Cambrian and Ordovician metasedimentary rocks, consisting of dolomite, quartzite, marble, limestone, slate, and phyllite (Jerris and DeSimone, 1992). Low angle thrust faults associated with the Late Ordovician Taconic Orogeny (~450 to 435 million years ago) carried the older Green Mountain Massif over the younger Vermont Valley rocks (Stanley and Ratcliffe, 1985; Doolan, 1996; Van Diver, 1987).

Recent local scale geologic mapping by VTANR indicates the Site lies over Cambrian aged quartzite and dolomite, gently dipping to the southeast. Specifically, these formations are the Cheshire Formation, consisting of non-calcareous quartzite; and the overlying Dunham Formation consisting of dolomitic quartzite/sandstone, dolomite and phyllite. A low-angle thrust fault (Silk Road Thrust) is mapped striking north-northeast west of Route 7 (Kim, 2017a). A thick mantle of glacially-derived sediments lies upon these formations. The quartzites of the Cheshire Formation, and to a lesser extent the dolomites of the Dunham Formation have been highly to completely hydrothermally altered to kaolin (a clay mineral), and to a lesser extent ochre and umber (iron and manganese hydroxides). Historically the kaolin, ochre and umber were mined in the area for source materials for ceramics and pigments (Burt, 1928; Gordon, 1914). The formation of these secondary materials is suspected to be hydrothermal (i.e., hypogene) replacement of the secondary silica cement in the primary lithologies with kaolin, ocher and umber, as reported for the large kaolin deposits north of the Site in Moncton, VT (also within the Cheshire Formation quartzites; Odgen, 1969). The alumina-bearing fluids causing the alteration may have been developed from granite and syenite of the Green Mountain Massif, and traveled along the fractures associated with the low-angle thrust

faults. The primary minerals dissolved by these fluids may largely have been the source of the kaolin, ocher and umber. The geologic timing of the alteration is unclear, but would likely be no older than the closing stages of the Taconic orogeny, and would predate the onset of glacial activity in the Early Pleistocene. The partially to completely altered quartzites and dolomites can attain vertical thicknesses of up to 300 feet as determined by site borings (McLaren/Hart, 1997).

2.0 OUTCROP MAPPING

2.1 Desktop Study

Golder conducted a desktop review of the 2017 VTANR geologic mapping (Kim, 2017a,b; Kim and Dowey, 2017), the Remedial Investigation Report documents on the Bennington Landfill (McLaren/Hart, 1997), and other regional geologic reports (Ratcliffe et al., 2011; Jerris and DeSimone, 1992; Potter, 1972; MacFayden, 1956; Burt, 1928; and Gordon, 1914) to identify publicly-accessible outcrop locations. Potentially-accessible outcrop locations were then further evaluated using Google Earth's Street View application for roadways having this feature.

Golder initially identified eight outcrop locations accessible from state highways and within 7,500 feet (ft) radius of the landfill. Summary information for these eight outcrop locations is presented below and Figure 1 illustrates the outcrop locations on a satellite photo/map. The table below summarizes these locations:

Outcrop Location	Latitude [dd mm.mmm]	Longitude [dd mm.mmm]	Access
OC-1	42° 53.955'N	73° 11.967'W	Northbound (right) U.S. Route 7, at Exit 1 off-ramp to eastbound VT Route 279
OC-2	42° 54.115'N	73° 11.920'W	Eastbound (right) VT Route 279, beneath and east of U.S. Route 7 overpass
OC-3	42° 54.371'N	73° 12.273'W	On-ramp (right) to northbound U.S. Route 7 from westbound VT Route 279
OC-4	42° 54.694'N	73° 12.485'W	Northbound (right) U.S. Route 7
OC-5	42° 55.306'N	73° 12.228'W	On-ramp (right) at Exit 2 to northbound U.S. Route 7 from Harwood Hill Road
OC-6	42° 55.786'N	73° 11.618'W	Southbound (right) U.S. Route 7 at median split (note: same access points for OC-6A & 6B stations)
OC-7	42° 55.739'N	73° 11.685'W	Northbound (left) U.S. Route 7 at median split (note: station not visited due to proximity of OC-6, 6A & 6B)
OC-8	42° 56.398'N	73° 10.909'W	Southbound (right) U.S. Route 7

Following identification of these locations, Golder contacted the Vermont Agency of Transportation (VTrans) lead engineering geologist on June 20, 2017 to seek permission to access these locations, and to let the regional VTrans district engineer know of the mapping program. The VTrans engineering geologist granted Golder permission on June 23, 2017 to access the locations, and advised the use of yellow safety vests, an amber rotating safety light, traffic cones, and a warning sign to alert drivers of our presence at the outcrops. These safety precautions were incorporated into our site-specific health and safety plan, and were used during the field mapping.

In late September 2017, at the beginning of the landfill investigation program, Golder also conducted reconnaissance geologic mapping of six outcrops exposed at the northwest portion of the landfill property, as recent publications (Kim, 2017a,b) and the landfill remedial investigation (McLaren/Hart, 1997) indicated the presence of outcrops in this area. Summary information for these six outcrop locations is presented below, and Figure 1 illustrates the outcrop locations on a satellite photo/map. The table below summarizes these locations:

DRAFT

Outcrop Location	Latitude [dd mm.mmm]	Longitude [dd mm.mmm]	Access
OC-9	42° 55.364'N	73° 12.163'W	From quarry access road at northwest corner of landfill, above crest of rip-rap armored slope of Exit 2 of Route 7
OC-9A	42° 55.369'N	73° 12.150'W	From quarry access road at northwest corner of landfill, subcrop in wooded area
OC-10	42° 55.388'N	73° 12.130'W	From quarry access road at northwest corner of landfill, outcrop in wooded area
OC-10A	42° 55.380'N	73° 12.112'W	From quarry access road at northwest corner of landfill, outcrop in wooded area
OC-11	42° 55.383'N	73° 12.041'W	On quarry access road at northwest corner of landfill
OC-12	42° 55.354'N	73° 12.062'W	In quarry pit area at northwest corner of landfill

2.2 Field Work

Golder's senior engineering geologist, assisted by a staff geological engineer conducted field mapping on June 27-28, 2017. Our field mapping investigation consisted of photographic documentation of the outcrops, lithologic descriptions, representative lithologic sampling, and mapping of discontinuities (i.e., breaks) in the rock masses. The discontinuities consisted of bedding planes, joints, faults, and mineral veins. In general, for a specific discontinuity to be noted and measured, it had a persistence greater than three (3) feet. We incorporated this criterion in the field measurements to avoid measuring insignificant discontinuities. We recorded the following notes and measurements for each discontinuity:

- Type (i.e., joint, foliation or vein)
- Orientation (dip and dip direction, degrees [°] and degrees azimuth)
- Persistence (feet, ft)
- Aperture (inches, in)
- Infilling material
- Strength
- Surface roughness
- Shape
- Water
- Discontinuity spacing (ft)

We measured orientations of the discontinuities using a Brunton™ geologic engineering compass with no magnetic declination correction. To correct for magnetic declination, we used a declination correction of 14° west of true north, as indicated by the National Oceanographic and Atmospheric Administration's (NOAA) website for Bennington, Vermont. This correction was applied while processing the data. Golder mapped 118 discontinuity features at the outcrop locations. Table 1 contains a summary of the discontinuity measurements and other notes by outcrop location. Appendix A contains select representative photographs of the outcrop locations.

The remainder of this section provides the lithologic descriptions and discontinuity summaries observed at each outcrop.

2.2.1 OC-1

Photos 1 and 2 of Appendix A show typical outcrop conditions for this location. The outcrop consists of a low, 20-foot (ft) high presplit blasted rock cut, about 375-ft long, striking roughly north-south. The lithology of this outcrop is dominated (~80%) by grayish orange (10 YR 7/4; weathered) to very pale orange (10 YR 8/2; fresh), very fine grained, recrystallized, thin to medium bedded, non-foliated, weakly cross-bedded, quartzite and orthoquartzite, with very close to closely spaced joints (0.07 to 0.7 ft). The minor lithology consists of dark greenish gray (5 GY 4/1; weathered) to greenish black (5 GY 2/1; fresh), fine- to medium-grained, strongly foliated, thinly laminated, biotite-muscovite-chlorite schist, interbedded within thin (up to 2-inch (in)) discontinuous, thinly laminated beds of very pale orange (10 YR 7/4), very fine grained quartzite, with very closely spaced joints (0.07 to 0.2 ft). Milky white quartz veins up to about 1-inch thick occur mostly within the schist. The schist overlies the quartzite at this location. Geologic mapping indicates this lithology is consistent with the Cambrian-aged Moncton Formation (Kim, 2017a,b; Ratcliffe et al., 2011; MacFayden, 1956).

DRAFT

Figure 2 contains a rose diagram and stereonet of the 16 discontinuity measurements from OC-1, generated from data analysis using the Dips (Rocscience, Inc., 2017) software program. These indicate two predominant joint sets (sets J1 and J2 in Table 1), striking north-northwest and east-northeast (respectively), with bedding dipping gently to the south (set B1 in Table 1). The joints have a persistence ranging from 3- to 40 ft; an aperture ranging from less than 0.1 to 2 inches; infilling of quartz veins, soil, silt, broken rock and iron oxide staining; are smooth to very rough; have planar, curved, curvilinear and irregular shapes; are dry to damp; and have spacings ranging from 0.08 to 3 ft. Bedding discontinuities have a persistence greater than 50 ft; apertures of 0.1 to 0.5 inches; quartz vein, soil, slit and broken rock infilling; are rough to very rough; have planar to irregular shapes; are dry to damp; and have spacings of 0.1 to 1 ft.

The OC-1 location corresponds with Domain 6 of the recent VTANR draft fracture map of the Bennington area (Kim, 2017b; note: we suspect the locations of Domain 6 and 7 are transposed on the map). The stereonet plot for Domain 6 indicates the VTANR data have slightly steeper bedding dips to the northwest, and shows three distinct fracture (or joint) sets. These joint sets do not correspond to the two predominant joint sets (J1 and J2) measured by Golder at this location.

2.2.2 OC-2

Photo 3 of Appendix A shows typical outcrop conditions for this location. The outcrop consists of a low, 25-ft high presplit blasted rock cut, about 510-ft long, striking east-west, with the majority of exposure east of the overpass. Four lithologies exist in this outcrop: 1) a light olive gray (5 Y 6/1; weathered), yellowish gray (5 Y 8/1; fresh), thin to medium bedded, fine-grained, weakly cross-bedded quartzite at the west end of the exposure; grading downwards (and to the west) to 2) a grayish orange (10 YR 7/4; weathered), medium dark gray (N4; fresh), fine to medium grained, weakly foliated, phyllitic quartzite (with minor siltstone), containing recumbent minor folding, fine grained discontinuous milky quartz veins (mostly concordant with foliation), and pyrite cubes; grading further downward into 3) alternating layers of grayish orange (10 YR 7/4; weathered), dark gray (N3; fresh), moderately foliated, fine-grained phyllite and medium-grained schist, containing recumbent minor folding, coarse-grained milky white quartz veins (both concordant with foliation, and discordant as near vertical tension gashes up to ~2-ft long), and pyrite cubes; grading upward into 4) a quartzite similar to 1) described above, present on the west side of the overpass with open folds. Geologic mapping indicates this lithology is also consistent with the Cambrian-aged Moncton Formation (Kim, 2017a; Ratcliffe et al., 2011; MacFayden, 1956).

Figure 3 contains a rose diagram and stereonet of the 24 discontinuity measurements from OC-2. These indicate two predominant joint sets exist (sets J1 and J2 in Table 1), striking northeast and southeast (respectively), with bedding dipping gently to the south (set B1 in Table 1). The joints have a persistence ranging from 3 to 30 ft; an aperture ranging from less than 0.1 to 3 inches; infilling of quartz veins, soil, broken rock, vegetative matter and iron oxide staining; are smooth to very rough; have planar, curved, curvilinear and irregular shapes; are dry to damp; and have spacings ranging from 0.2 to 5 ft. Bedding discontinuities have a persistence ranging from 7 to greater than 50 ft; apertures of 0.1 inch or less; no infilling or are stained with iron hydroxides; are smooth to rough; have planar, undulating and wavy shapes; are dry to seeping; and have spacings of 0.2 to 1.5 ft. One steeply-dipping discontinuity with an aperture of 3 inches was mapped at this outcrop station, and is a suspected normal fault with little movement (ID 16 on Table 1).

The OC-2 location corresponds with Domain 8 of the recent VTANR draft fracture map of the Bennington area (Kim, 2017b). The stereonet plot for Domain 8 indicates the VTANR data have slightly steeper bedding dips to the northwest compared with the Golder bedding data set, and shows three distinct fracture (or joint) sets. Two of these joint sets correspond to the two predominant joint sets (J1 and J2) measured by Golder at this location.

2.2.3 OC-3

Photos 4 through 8 of Appendix A show typical outcrop conditions for this location. The outcrop consists of a low, 20-ft high production blasted rock cut, about 580-ft long, striking west-northwest. The lithology of this outcrop varies, but consists of three dominant types: 1) Very pale orange (10 YR 8/2) to pale olive (10

DRAFT

Y 6/2; weathered), grayish pink (5 R 8/2) to medium dark gray (N4; fresh), thin to medium bedded, non-foliated, weakly weathered, fine to medium grained, weakly cross bedded, slightly calcareous quartzite, with thin veins and coatings of calcite. Joints are closely to moderately spaced (0.2 to 2 ft), and weak ripple marks are preserved on bedding surfaces. 2) Light olive gray (5 Y 6/1), moderate brown (5 YR 4/4), grayish orange (10 YR 7/4; weathered), light brownish gray (5 YR 6/1; fresh), thinly laminated, moderately foliated, very thinly bedded, moderately to highly to completely weathered, very fine grained, micaceous siltstone and phyllite, with abundant pyrite cubes to 0.25-inch, which is the source of heavy iron oxide/hydroxide staining. 3) Olive gray (5 Y 4/1; weathered), medium dark gray (N4; fresh), slightly to moderately weathered, very fine grained, thin to medium bedded to laminated, non-foliated dolomite, with pronounced "elephant skin" weathering, containing thin milky white quartz veins. Geologic mapping indicates this lithology is consistent with the Cambrian-aged Dunham Formation (Kim, 2017a; Ratcliffe et al., 2011; MacFayden, 1956).

Figure 4 contains a rose diagram and stereonet of the 16 discontinuity measurements from OC-3. These indicate three predominant joint sets exist, striking north, north-northeast, and northwest (sets J1, J2 and J3, respectively; see Table 1), with bedding dipping moderately to the southeast (set B1 in Table 1). The joints have a persistence ranging from 3 to 40 ft; an aperture ranging from less than 0.1 to 5 inches; infilling of calcite veins/precipitate, broken rock, vegetative matter and iron oxide staining; are smooth to very rough; have planar, irregular, undulating, stepped, and curved shapes; are dry to flowing; and have spacings ranging from 0.2 to 5 ft. Bedding discontinuities have a persistence ranging from 15 to 50 ft; apertures of 0.1 to 0.5 inches; infilling consisting of decomposed rock, broken rock, silica, oxidized pyrite, and iron oxides; are smooth to very rough; have planar, wavy, and undulating (i.e., ripple marks) shapes; are dry; and have spacings of 0.04 to 1 ft.

During mapping, we located a spring in the middle portion of the outcrop within highly weathered, dark gray phyllite, with an estimated groundwater flow of 1 to 2 gallons per minute (gpm; see Photos 6 through 8 of Appendix A). The spring occurs along a joint (discontinuity #12 of OC-3 in Table 1), open approximately 5-inches, and dipping steeply to the east. The spring opening contains precipitated calcite. Due to presence of green moss, abundant lush vegetation and snails, it is likely that this spring is perennial.

The OC-3 location corresponds with Domain 7 of the recent VTANR draft fracture map of the Bennington area (Kim, 2017b; note: we suspect the locations of Domain 6 and 7 are transposed on the map). The stereonet plot for Domain 7 indicates the VTANR data have similar orientations as the Golder bedding data set (both dipping gently to the northwest), and shows up to six distinct fracture (or joint) sets. Only one of these joint sets corresponds to one of the predominant joint sets (J1) measured by Golder at this location.

2.2.4 OC-4

Photo 9 of Appendix A shows typical outcrop conditions for this location. The outcrop consists of a low, 20-ft high presplit blasted rock cut, about 900-ft long, striking north-south. The lithology of this outcrop consists of pale yellowish brown (10 YR 6/2) to grayish red (5 R 4/2; weathered), grayish orange-pink (5 YR 7/2; fresh), thin to medium bedded, fine to medium grained, recrystallized, non-foliated, weakly cross bedded, weakly weathered to fresh, very strong quartzite, with dark reddish iron and black manganese oxide/hydroxide staining. The orthogonal nature of the predominant joint sets and bedding produce a blocky weathering condition. Geologic mapping indicates this lithology is consistent with the Cambrian-aged Cheshire Formation (Kim, 2017a; Ratcliffe et al., 2011; MacFayden, 1956).

Figure 5 contains a rose diagram and stereonet of the 24 discontinuity measurements from OC-4. These indicate two predominant joint sets exist (sets J1 and J2 in Table 1), striking north-northeast and west-northwest (respectively), with bedding dipping gently to the southwest (set B1 in Table 1). The joints have a persistence ranging from 5 to greater than 50 ft; an aperture ranging from less than 0.1 to 14 inches; infilling of soil, quartz, iron hydroxide staining, broken rock, and organic matter; are very smooth to very rough; have planar, stepped, curved, to irregular shapes; are dry to damp; and have spacings ranging from 0.08 to 4 ft. Bedding discontinuities have a persistence ranging from 25 to greater than 50 ft; apertures of less than 0.1 inch to 1 inches; infilling consisting of broken rock, soil, and organic matter; are smooth to

DRAFT

very rough (with ripple marks and flute casts); have planar shapes; are dry to flowing; and have spacings of 0.08 to 1 ft.

During mapping, we located a seep along a bedding plane (discontinuity #3 of OC-3 in Table 1), with an estimated groundwater flow of 1 gpm. This seep may not be perennial.

The OC-4 location corresponds with Domain 5 of the recent VTANR draft fracture map of the Bennington area (Kim, 2017b). The stereonet plot for Domain 5 indicates the VTANR data have similar orientations as the Golder bedding data set (both dipping gently to the southwest), and shows three distinct fracture (or joint) sets. Two of these joint sets correspond to the two predominant joint sets (J1 and J2) measured by Golder at this location.

2.2.5 OC-5 and OC-5A

Photo 10 of Appendix A shows typical outcrop conditions. The outcrop consists of a circular shaped rock cut, 25- to 40-ft high, presplit and production blasted, about 950-ft long, occupying the center of the on-/off-ramp. An exposure of the same lithology exists in the gore between the north-bound off ramp and Route 7, and this location was designated OC-5A. The lithology of these outcrops consists predominantly of pale yellowish brown (10 YR 6/2) and grayish orange pink (5 YR 7/2; weathered), pale red (10 R 6/2; fresh), thin to medium bedded, fine to medium grained, recrystallized, non-foliated, weakly cross bedded, very strong quartzite, with occasional trace fossil worm burrows (*skolithos*), a common Cambrian trace fossil. A minor lithology consists of medium light gray (N6; weathered), medium dark gray (N4; fresh), very fine grained, thinly laminated, weakly foliated, siltite/phyllite. Geologic mapping indicates this lithology is consistent with the Cambrian-aged Cheshire Formation (Kim, 2017a; Ratcliffe et al., 2011; MacFayden, 1956).

Figure 6 contains a rose diagram and stereonet of the 18 discontinuity measurements from OC-5 and OC-5A. These indicate two predominant joint sets exist (J1 and J2 in Table 1), striking northeast and northwest (respectively), with bedding dipping gently to the west (B1 in Table 1). The joints have a persistence ranging from 8 to greater than 50 ft; an aperture ranging from less than 0.1 to 2 inches; infilling of broken rock, soil, iron hydroxide, quartz, and organic matter; are very smooth to very rough; have planar, irregular, to stepped shapes; are dry to damp; and have spacings ranging from 0.5 to 4 ft. Bedding discontinuities have a persistence ranging from 30 to greater than 50 ft; apertures of less than 0.1 inch to 0.25 inches; infilling consisting of broken rock, soil, and organic matter; are rough to very rough (with flute and cast marks); have planar shapes; are dry to seeping; and have spacings of 0.2 to 2 ft.

The OC-5 and OC-5A locations correspond with Domain 3 of the recent VTANR draft fracture map of the Bennington area (Kim, 2017b). The stereonet plot for Domain 3 indicates the VTANR data have similar orientations as the Golder bedding data set (both dipping gently to the west), and shows two distinct fracture (or joint) sets. These joint sets correspond to the two predominant joint sets (J1 and J2) measured by Golder at these locations.

2.2.6 OC-6, OC-6A and OC-6B

Photos 11 through 14 of Appendix A show typical outcrop conditions for these locations. The outcrops consist of very low, 2- to 5-ft high, and 20- to 110-ft long exposures, striking roughly east-northeast, within about a 500-ft radius. The lithology of these outcrops consists of pinkish gray (5 YR 8/1) to yellowish gray (5 Y 8/1; weathered), grayish orange pink (10 R 8/2), thin to medium bedded, fine to coarse grained, pebbly, recrystallized, non-foliated, weakly cross bedded, very strong quartzite, with occasional *skolithos*. Geologic mapping indicates this lithology is consistent with the Cambrian-aged Cheshire Formation (Kim, 2017; Ratcliffe et al., 2011; MacFayden, 1956).

Figure 7 contains a rose diagram and stereonet of the 16 discontinuity measurements from the OC-6 outcrops. These indicate two predominant joint sets exist (sets J1 and J2 in Table 1), striking north-northeast and northwest (respectively), with bedding dipping gently to the southeast (set B1 in Table 1). The joints have a persistence ranging from 2 to 10 ft; an aperture ranging from 0.1 to 1 inches; infilling of

DRAFT

broken rock, soil, manganese/iron hydroxides, and organic matter; are smooth to rough; have planar, curved, irregular and stepped shapes; are dry to damp; and have spacings ranging from 0.7 to 6 ft. Bedding discontinuities have a persistence ranging from 2 to 30 ft; apertures of less than 0.1 inch to 0.25 inches; infilling consisting of broken rock and soil; are smooth to rough (with flute and cast marks); have planar shapes; are dry; and have spacings of 0.3 to 0.5 ft.

The OC-6, OC-6A and OC-6B locations correspond with Domain 2 of the recent VTANR draft fracture map of the Bennington area (Kim, 2017b). The stereonet plot for Domain 2 indicates the VTANR joint data occur in two distinct fracture (or joint) sets. These joint sets correspond to the two predominant joint sets (J1 and J2) measured by Golder at these locations. While the VTANR rose diagram for Domain 2 and the tabulated data set indicate VTANR measured four bedding orientations, these are not plotted on the Domain 2 stereonet; therefore we cannot compare the VTANR bedding data with the Golder bedding data at these locations.

Note that due to the proximity of the ample exposures at OC-6, OC-6A and OC-6B, the field crew elected to not visit OC-7 during the field work. OC-7 exposures are oriented in a similar manner as OC-6, OC-6A and OC-6B.

2.2.7 OC-8

Photo 15 shows the outcrop condition for this locations. The outcrop consists of very small limited exposure, only 1-ft high, and about 25-ft square on the northwest side of the highway. The lithology of this outcrop consists of light brown (5 YR 5/6; weathered), grayish orange pink (10 R 8/2; fresh), fine grained, thin to medium bedded, recrystallized, non-foliated, very strong quartzite. Geologic mapping indicates this lithology is consistent with the Cambrian-aged Cheshire Formation (Kim, 2017a; Ratcliffe et al., 2011; MacFayden, 1956).

Figure 8 contains a rose diagram and stereonet of the discontinuity measurements from the OC-6 outcrops. Only four (4) discontinuity measurements were obtained at this location. These indicate two predominant joint sets exist (sets J1 and J2 on Table 1), striking north-northwest and northeast, with bedding dipping gently to the east-southeast (set B1 on Table 1). The joints have a persistence ranging from 3 to 10 ft; an aperture ranging from 0.1 to 1 inches; infilling of soil and organic matter; are smooth; have a planar shape; are damp; and have spacings ranging from 1 to 1.5 ft. The measured bedding discontinuity has a persistence of 1 ft (limited by the small outcrop size); an aperture of 0.25 inches; infilling consisting of organic matter; is smooth; has a planar shape; is damp; and has a spacing of 1 ft.

Location OC-8 was not included in the recent VTANR draft fracture map of the Bennington area (Kim, 2017b).

2.2.8 OC-9 and 9A

Photos 16 and 17 show the outcrop and subcrop conditions for these locations. The outcrops consists of limited exposures, at or just below the forest duff grade, and up to 2-ft high. The lithology of these outcrops consists of light brownish gray (5 YR 6/1; weathered), pinkish gray (5 YR 8/1; fresh), fine to medium grained, thin to medium bedded and cross bedded, recrystallized, non-foliated, very strong quartzite, with milky white quartz veins predominantly in near vertical joints. Geologic mapping indicates this lithology is consistent with the Cambrian-aged Cheshire Formation (Kim, 2017a; Ratcliffe et al., 2011; MacFayden, 1956).

Figure 9 contains a rose diagram and stereonet of the discontinuity measurements from the OC-10 and 10A outcrops. Thirteen (13) discontinuity measurements were obtained at this location. These indicate one predominant joint set exists (set J1 Table 1), striking north-northeast, with bedding dipping gently to the east-southeast (set B1 on Table 1). The joints have a persistence ranging from 0.5 to 12 ft; an aperture ranging from less than 0.1 to 3 inches; infilling of soil, broken rock, iron/manganese staining, and organic matter; are smooth to very rough; have planar, curved, undulating, stepped and irregular shapes; are dry; and have spacings ranging from 0.2 to 7 ft. The measured bedding discontinuities have a persistence

DRAFT

ranging from 0.75 to 20 ft; are smooth to very rough; have planar, curved and stepped shapes; are dry; and have a spacing of 0.25 ft.

The OC-9 and OC-9A locations may correspond with Domain 4 of the recent VTANR draft fracture map of the Bennington area (Kim, 2017b). The stereonet plot for Domain 4 indicates the VTANR joint data occur in one distinct fracture (or joint) set. This joint set corresponds to predominant joint set J1 measured by Golder at these locations. The stereonet plot for Domain 4 indicates the VTANR data do not have similar orientations as the Golder bedding data set, with the VTANR data indicating gentle bedding dips to the southeast, and the Golder data indicating gentle bedding dips to the west. This discrepancy may be due to different measurement locations and/or the presence of slight folding of the bedding.

2.2.9 OC-10 and 10A

Photos 18 and 19 show the outcrop and subcrop conditions for these locations. The outcrops consists of low exposures up to 2-ft high. The lithology of these outcrops consists of light brownish gray to brownish gray (5 YR 6/1 and 5 YR 4/1, respectively; weathered), grayish pink to pale red (5 R 8/2 and 5 R 6/2, respectively; fresh), fine to medium grained, thin to medium bedded and weakly cross bedded, recrystallized, non-foliated, very strong quartzite. Geologic mapping indicates this lithology is consistent with the Cambrian-aged Cheshire Formation (Kim, 2017a; Ratcliffe et al., 2011; MacFayden, 1956).

Figure 10 contains a rose diagram and stereonet of the discontinuity measurements from the OC-10 and 10A outcrops. Eleven (11) discontinuity measurements were obtained at these locations. These indicate two predominant joint sets exists (sets J1 and J2 in Table 1), striking north-northeast and west-northwest (respectively), with bedding dipping gently to the west (set B1 on Table 1). The joints have a persistence ranging from 0.75 to 20 ft; an aperture ranging from less than 0.1 to 2.5 inches; infilling of soil, broken rock, and organic matter; are smooth to very rough; have planar, curved, undulating, and irregular shapes; are dry to moist; and have spacings ranging from 0.5 to 3 ft. The measured bedding discontinuities have a persistence ranging from 3 to 8 ft; are smooth to rough; have planar and stepped shapes; are dry; and have spacings ranging from 0.25 to 2.5 ft.

The OC-10 and OC-10A locations correspond with Domain 4 of the recent VTANR draft fracture map of the Bennington area (Kim, 2017b). The stereonet plot for Domain 4 indicates the VTANR joint data occur in one distinct fracture (or joint) set. This joint set corresponds to predominant joint set J1 measured by Golder at these locations. The stereonet plot for Domain 4 indicates the VTANR data do not have similar orientations as the Golder bedding data set, with the VTANR data indicating gentle bedding dips to the southeast, and the Golder data indicating gentle bedding dips to the west. This discrepancy may be due to different measurement locations and/or the presence of slight folding of the bedding.

2.2.10 OC-11 and 12

Photos 20 to 22 show the outcrop conditions for these locations, near and within the landfill quarry pit. The outcrops consists of at-grade exposures in the access road, and ledge exposures up to 10-ft long (note that blasting associated with the quarry may have disturbed these locations). The lithology of these outcrops consists of grayish orange to yellowish gray (10 YR 7/4 and 5 Y 8/1, respectively; weathered), pinkish gray (5 YR 8/1; fresh), fine to medium grained, very well sorted, thin to medium bedded and cross bedded, recrystallized, non-foliated, very strong quartzite, with milky white quartz veins predominantly in near vertical joints, and rare trace fossil worm burrows (*skolithos*). Geologic mapping indicates this lithology is consistent with the Cambrian-aged Cheshire Formation (Kim, 2017a; Ratcliffe et al., 2011; MacFayden, 1956).

Figure 11 contains a rose diagram and stereonet of the discontinuity measurements from the OC-10 and 10A outcrops. Eleven (11) discontinuity measurements were obtained at these locations. These indicate two predominant joint sets exists (sets J1 and J2 in Table 1), striking north-northeast and west-northwest (respectively), with bedding dipping gently to the southeast (set B1 on Table 1). The joints have a persistence ranging from 1 to 7 ft; an aperture ranging from less than 0.1 to 1 inch; infilling of broken rock and silt; are smooth to rough; have planar, stepped, undulating, and irregular shapes; are dry; and have

DRAFT

spacings ranging from 0.25 to 1 ft. The measured bedding discontinuities have a persistence ranging from 5 to 8 ft; are very rough; have planar, irregular, and stepped shapes; are dry; and have spacings ranging from 0.2 to 2.5 ft.

The OC-11 and OC-12 locations correspond with Domain 4 of the recent VTANR draft fracture map of the Bennington area (Kim, 2017b). The stereonet plot for Domain 4 indicates the VTANR joint data occur in one distinct fracture (or joint) set. This joint set corresponds to predominant joint set J1 measured by Golder at these locations. The stereonet plot for Domain 4 indicates the VTANR data have similar orientations as the Golder bedding data set, both dipping gently to the southeast.

2.2.11 Composite Discontinuity Data

Figure 12 presents the entire discontinuity data set as a rose diagram and stereonet. The data show the presence of three major discontinuity sets, consisting of bedding (B1), and two joint sets (J1 and J2). The bedding poles shown on the stereonet show the local variation in bedding, ranging from dipping shallowly to the southeast to northwest. This is consistent with the broad, open folding recently mapped in the area (Kim, 2017a). The two predominant joint sets, J1 and J2 have approximate average azimuthal trends of 021° and 306°, respectively. The poles plotting within the 2% contour interval in the stereonet indicate the possibility of two minor joint sets (J3 and J4), having azimuthal trends of 163° and 103°, respectively.

Table 2 provides a summary of the discontinuity set data statistics, including the average, minimum, maximum, range, and data count persistence, aperture and spacing for each set. Of the three major discontinuity sets, Golder concludes:

- The bedding has the closest spacing, longest persistence and narrowest aperture.
- Joint Set 1 and Joint Set 2 have similar persistence, aperture and spacing, with Joint Set 1 less persistent and more closely spaced.
- Joint Set 2 has an average aperture twice as large as Joint Set 1.

This indicates the differences in the persistence, aperture and spacing of the two predominant joint sets is minimal, while the bedding is more persistent, narrower in aperture, and more closely spaced. It should be noted that the bedding has relatively low dips, and open, broad folding which creates a bias based on the limited extent of the outcrop exposures.

3.0 PHOTO LINEAMENT ANALYSIS

Golder conducted a photo lineament analysis of the area around the landfill with an approximate radius of 12,500 ft. The purpose of the lineament analysis was to identify possible joint sets at the regional level, and compare their orientations with those collected during the outcrop study, and to compare the results with a similar study conducted for the investigation of the landfill (McLaren/Hart, 1997).

Photo lineament analysis is a remote sensing technique to identify tonal variations that may indicate the presence of fractures and fracture trends within the bedrock or surficial geologic materials. The analysis was conducted using stereo aerial photograph pairs with a 60% overlap, viewed using a stereoscope to produce a three-dimensional image of the ground surface. The aerial photograph pairs are taken to produce a vertical exaggeration of 2X so that subtle tonal variations and surface topographic trends are artificially more pronounced for easier identification.

Golder evaluated publically available black and white stereo air photo images archived on the U.S. Geological Survey's Earth Explorer website (USGS, 2007). Factors used to select the images included scale, extent covered and timeframe taken. Golder located six (6) high-resolution, historical sets of color and black and white stereo air photo flights that covered the landfill area. The scales ranged from 1: 27,200 to 1:80,000. The dates ranged from September 1942 to October 1977. Of these, the September 1, 1942 photographs were taken at the largest scale, i.e., 1:27,200. They are also the oldest photographs, and as such, contained the least amount of developed area of the sets. Development in the form of road

DRAFT

construction, building, farm development, logging, land clearing, landfilling, mining, waterway construction, etc. can mask natural lineaments. Golder therefore chose the 1942 photos for the lineament analysis.

The analyst evaluated the nature of each potential lineament, based on its topographic expression and tonal variations, to estimate whether the lineament was a natural feature. Such features consist of: natural stream and river drainages; lines of robust vegetation growing along fractures carrying groundwater; elevated or reduced tree heights indicating possible variations in groundwater availability along fractures; animal pathways (animals often take the path of least resistance, which may be along a fracture trend); and actual joint sets expressed in the topographic surface, either in bedrock or within shallow surface cover. The analyst then recorded an identification number of each lineament traced, the azimuthal trends, approximate lengths, and spacing to the nearest lineament of the same set. The lineament analysis for both air photos is provided in Appendix B.

The results of the lineament analysis are summarized in Table 3 and on the rose diagram in Figure 10. The lineament analysis indicates there are two predominant lineament directions present around the landfill area, with average azimuthal trends of 044° (roughly northeast-southwest), and 311° (roughly northwest-southeast). These trends are consistent with the two dominant trends presented in the landfill remedial study (McLaren/Hart, 1997); however Golder's analysis did not confirm the two north-south and east-west lineament trends presented in that study. This may be due to fact that the McLaren/Hart study was based aerial photographs taken in 1991, and therefore influenced by anthropogenic development.

The following table provides a summary of the average joint set azimuth trend, persistence and spacing range/arithmetic mean measured from the lineament analysis:

Joint Set	Average Trend (azimuth)	Persistence (ft)	Spacing Range/ Arithmetic Mean (ft)
J1	044°	950	50 – 2,200/380
J2	312°	967	100 – 3,700/705

4.0 SUMMARY OF FINDINGS

The outcrop mapping verifies the recent regional geologic mapping (Kim, 2017a), and indicates the potential presence of a broad, open anticlinal fold with its axis west of the landfill. The outcrop mapping and lineament analysis indicate two predominant fracture trends exist in the area of the landfill. These have average azimuthal trend ranges of 021° to 044° for joint set J1, and 306° to 312° for joint set J2. Based on the lineament analysis, joint set J2 is on average, more widely spaced than joint set J1; this observation is also evident in the outcrop-scale data, but to a lesser degree. The discontinuities formed by these predominant joint sets, along with discontinuities formed by the bedding planes, likely influence groundwater flow within the bedrock, forming preferential groundwater flow pathways parallel to their orientations.

The middle orientation of these trends (033° and 310° for J1 and J2, respectively) are shown on Figures 14, 15 and16, relative to the landfill. These trend zones can be used to help site potential new monitoring wells southwest, south and southeast of the landfill. Analysis of the two predominant joint sets from the outcrop mapping indicates they differ little with respect to persistence, aperture and spacing, and there likely is not a predominant bias between the two in controlling fracture-dominated groundwater flow.

Notes:
(1) Discontinuity sets are as follows:
B1 = Bedding
J1 = Joint Set 1
J2 = Joint Set 2
J3 = Joint Set 3
J4 = Joint Set 4

(2) Dip direction data corrected for magnetic declination (14 degrees west of north).

(3) Shear strength of infilling materials as follows:
Low = friction angle < 20 degrees
Medium = 20 degrees < friction angle < 30 degrees
High = 30 degrees < friction angle

N/A = not applicable
ft = feet; in = inches

APPENDIX A
OUTCROP MAPPING PHOTO LOG

DRAFT

PHOTO 1 Photo of OC-1 location within the Moncton Formation, view to north-northeast. Note bedding dipping gently to the south (photo date 06/27/17, file IMG_9339.JPG).	
PHOTO 2 Photo of OC-1 location, view to southeast (photo date 06/27/17, file DSC_1786.JPG).	

DRAFT

PHOTO 3 Photo of OC-2 location within the Moncton Formation, view to east. Note bedding dipping gently to the south (photo date 06/27/17, file IMG_9365.JPG).	
PHOTO 4 Photo of southeast end of OC-3 location within the Dunham Formation, view to northwest. Note bedding dipping moderately to the southeast, and preserved ripple marks (photo date 06/27/17, file DSC_1805.JPG).	

DRAFT

PHOTO 5 Photo of northwest end of OC-3 location, view to east (photo date 06/27/17, file DSC_1820.JPG).	
PHOTO 6 Photo of middle portion of OC-3, showing location of flowing spring, view to north (photo date 06/27/17, file DSC_1820.JPG).	

DRAFT

PHOTO 7

Photo of middle portion of OC-3, showing detailed location of flowing spring, emanating from open, near vertical joint dipping steeply to the east, and striking north-south, within highly weathered dark gray phyllite with milky white quartz veins and iron hydroxides. View to north (photo date 06/27/17, file IMG_9382.JPG).

PHOTO 8

Close-up photo of spring at OC-3 at coordinates N 42° 54.370', W 073° 12.289', hand-held GPS for scale. Note green moss and snails suggesting possible perennial flow (photo date 06/27/17, file IMG_9375.JPG).

DRAFT

PHOTO 9 Photo of middle portion of OC-4 (beneath high-tension power lines), showing typical conditions of the Cheshire Formation, view to northeast. Note orthogonal quartzite blocks formed from nearly horizontal bedding and two steeply dipping joint sets (photo date 06/28/17, file IMG_9388.JPG).	
PHOTO 10 Photo of middle portion of OC-5, showing bedding dipping moderately to the west in the Cheshire Formation (photo date 06/28/17, file DSC_1861.JPG).	

DRAFT

PHOTO 11 Photo of middle portion of OC-6, showing bedding dipping gently to the southeast in the Cheshire Formation. View to the northeast (photo date 06/28/17, file DSC_1886.JPG).	
PHOTO 12 Panoramic photo of OC-6A, showing bedding dipping gently to the southeast in the Cheshire Formation. View to the east (photo date 06/28/17, files DSC_1892 & DSC_1893.JPG).	

DRAFT

PHOTO 13 Photo of OC-6B, showing bedding dipping gently to the southwest in the Cheshire Formation. View to the west (photo date 06/28/17, file DSC_1894).	
PHOTO 14 Photo of OC-6B, showing bedding dipping gently to the southeast in the Cheshire Formation. View to the west (photo date 06/28/17, file DSC_1888).	
DRAFT

PHOTO 15 Photo of OC-8 within the Cheshire Formation, view to the west (photo date 06/28/17, file IMG_9394).	
PHOTO 16 Photo of OC-9 within the Cheshire Formation, view to the south-southwest, field book for scale (photo date 09/26/17, file IMG_0117).	

DRAFT

PHOTO 17 Photo of OC-9A subcrop within the Cheshire Formation (photo date 09/26/17, file IMG_0120).	
PHOTO 18 Photo of OC-10 outcrop within the Cheshire Formation (photo date 09/26/17, file IMG_0137).	

DRAFT

PHOTO 19 Photo of OC-10A outcrop within the Cheshire Formation, field book and hand-held GPS unit for scale. View to north-northeast (photo date 09/26/17, file IMG_0139).	
PHOTO 20 Photo of OC-11 subcrop within the Cheshire Formation, exposed in landfill access road. View to southwest (photo date 09/26/17, file IMG_0157).	
DRAFT

PHOTO 21 Photo of OC-12 outcrop within the Cheshire Formation, exposed in quarry pit area. View to southwest (photo date 09/26/17, file IMG_0164).	
PHOTO 22 Close-up photo of OC-12 outcrop within the Cheshire Formation, exposed in quarry pit area. Note faint cross-bedding dipping to southeast (to left), in bed crossed by blue mechanical pencil (photo date 09/26/17, file IMG_0165).

BARR

Memorandum

To: File
From: Michael Dupay, Ward Swanson
Subject: Total Oxidizable Precursor Assay Analysis and Results – Bennington Landfill Split Sampling (May 2017)
Date: November 21, 2017
Project: 45021004.00

Background

Groundwater sampling was conducted in accordance with the *CSM Site Investigation: Bennington, Vermont Work Plan* (Barr, 2017a) on behalf of Saint-Gobain Performance Plastics (Saint-Gobain) at the Bennington Landfill (landfill) as part of the planned sampling for comparison to and refinement of the Conceptual Site Model (CSM) of per- and poly-fluoroalkyl substance (PFAS) fate and transport developed for the area. The CSM has been developed from site data, chemical characteristics of PFASs, and modeling studies of processes important to PFAS fate and transport, as described in the *Draft Conceptual Modeling of PFOA Fate and Transport: North Bennington, Vermont. Prepared for Saint-Gobain Performance Plastics* (Draft CSM Report, Barr, 2017b). Water samples collected as part of the investigative work from existing landfill monitoring wells MW07, B-12, MW100S, B-2-1, and B-2-2 and the landfill leachate vault (VLT-01) were sent to Test America (TA) Sacramento, located in West Sacramento, California for analysis by the Total Oxidizable Precursors (TOP) Assay, and to Eurofins Lancaster Laboratories Environmental (ELLE) in Lancaster, Pennsylvania for PFAS analysis. TA was the only laboratory of the two with TOP Assay protocols in place at the time of the analysis. This memorandum describes the results of the TOP Assay provided by TA and a comparison to corresponding PFAS concentrations from ELLE.

TOP Assay Methodology

Current methodologies for measuring PFASs (EPA 537) do not represent the thousands of parameters that are not currently measured by the analysis that may, under certain conditions, be converted to PFASs over time (Buechler, 2017). It has been proposed that the TOP Assay analysis can provide a qualitative assessment of risk for other chemicals present within the sample to convert to PFASs by way of treatment under highly oxidizing and high-temperature conditions. Limitations of the assay include the potential for exhaustion of the oxidant and a tendency to underestimate precursor concentrations in samples with high proportions of flourotelomers with six carbons (C6) or fewer. Additionally, the conditions under which the assay is performed are not representative of environmental conditions.

Samples submitted to a TOP Assay are initially measured for PFASs via EPA 537. The samples are then subjected to the addition of potassium persulfate and sodium hydroxide under 85°C for six hours, followed by neutralization. The samples are then reanalyzed and the differences in values for target PFAS

DRAFT

compounds is calculated. Where there is a post-treatment increase in the concentration of a given target compound, there is a chance that some of the precursors that are not analytes of the EPA 537 method will convert to measurable amounts of the target compounds of concern over time and under certain conditions.

Data Quality

The quality assurance/quality control (QA/QC) data were reviewed to assess the validity of the sampling procedures and analytical results for the data. The analytical data were evaluated according to the procedures outlined in the Barr Data Validation Standard Operating Procedures for blanks, duplicates, and spiked samples, which are based on the EPA data validation procedures found in the National Functional Guidelines or on QA/QC sections in associated analytical methods. Any data qualifiers assigned during the validation process are Barr-defined qualifiers. Some modifications were made to the procedures to account for the practices in the Level 4 data review as conducted by Environmental Standards. The following observations are constrained to the PFAS analysis for the purposes of this memorandum.

In brief:

- Samples were analyzed within recommended hold times.
- Method blanks for PFASs were all non-detect for both laboratories, with the exception of PFBA detections in the post-treatment (TOP) analysis conducted by TA.
- Surrogate recoveries were frequently below criteria across most PFASs for both laboratories, and occasionally high for some in the post-treatment analysis by TA.
- LCS/LCSD recoveries were acceptable for ELLE and the pretreatment analysis by TA; however, recoveries were frequently out of control for the post-treatment analysis by TA, biased both low and high.
- TA did not note that some post-assay calculations were potentially affected by the inclusion of results that were qualified by the laboratory—namely, Total PFASs (pretreatment), Total PFASs (post-treatment), and Total PFAS differences (pretreatment results subtracted from post-treatment results). Those reported summation or differential results should be considered estimated values due to the uncertain nature of the values used for calculation.
- In at least one calculation of Total PFAS differences by TA, values calculated by Barr were not consistent with the laboratory's reported value. This is likely attributable to calculations being conducted with numbers prior to rounding by their LIMS.

All data are considered acceptable, except where noted or qualified.

Data Assessment

Lab analytical data are provided in Tables 1 and 2. Data were evaluated in two ways:

DRAFT

- Relative Percent Differences (RPD) between laboratories to measure precision
- Precursor presence from TOP analysis and potential for future contributions from precursors

Results between laboratories were generally consistent across most parameters, with the exception that ELLE often reported J-flagged results (values between the detection limit and the reporting limit) and TA did not report values below the reporting limit. As such, RPDs were not calculated for those parameters where one laboratory reported a J-flagged result and the other reported a non-detected value. Of the remaining values usable for the purposes of calculating RPDs, 20% had values greater than 30% RPD, three of which are associated with PFBA results, and the other two occur when one lab or the other reported non-detect for a given parameter, and the other lab reported a value above their mutual reporting limits. Table 3 presents the RPDs for the samples below.

Table F.3 Relative Percent Differences between TA and ELLE Sample Results

Sample	Parameter	TA Pretreatment Result (ng/L)	ELLE Result (ng/L)	RPD (%)
MW07	PFOA	18	16	11.76

The laboratories were largely in agreement as to the composition of most of the samples, given the potential for random and systemic errors associated with analyses, especially at the scale measured for PFASs. In general, ELLE data reports values slightly lower than that reported by TA.

Pretreatment and post-treatment data for parameters with positive increases post-treatment in one or more samples are included in Table 4. A full table of pretreatment, post-treatment, and differences is attached (Table 1).

Table F.4 TOP Assay Results and Differences (as reported)

Total PFAS	38	55	**17**	7000	7400	**410**

In gray = positive increase after treatment
In red = subject to influence via blank detection; either likely false positives or elevated due to potential false positives

As previously noted, during the review of the data, PFBA was present in the method blanks for all the post-treatment samples in concentrations similar to those reported in the pretreatment results (12.7 ng/L and 16.1 ng/L). As such, the PFBA results reported for the post-treatment are suspect and the values calculated based on the values are likewise suspect (PFBA concentrations and differences, and total PFASs concentrations and differences). Given the presence of artificially introduced PFBA in the post-treatment sample, there are expected to be low amounts of PFBA precursors apparent in all of the samples collected, with the exception of the leachate vault sample, which exhibits signs of all target PFASs except for PFNA (and possibly PFBA). Aside from the leachate vault (VLT-01) and well B-12, PFAS precursors outside of PFOA are absent, assuming that the presence of PFBA is attributable to blank contamination. The sample for B-12 contained trace levels of precursors for all but PFNA and PFOA, while the leachate vault shows higher levels of all target PFASs aside from PFNA and the potential false positive result reported for PFBA.

Wells B-2-1 and B-2-2 are adjacent to the leachate vault and do not appear to be influenced by the vault concentrations. B-12 shares some of the same precursors with the leachate vault, but PFOA is notably absent from the change in precursors. MW07 is on the perimeter of the Bennington Landfill and exhibits some of the same precursors as B-2-1 and B-2-2.

In review of the potential precursors, the leachate vault has the most significant potential sources of precursors within the landfill. All available TOP Assay results for the vault are provided in Table 5 and the complete TOP Assay results are provided in Table 2 (attached).

Table F.5 Complete TOP Assay Results, Vault (as reported)

Parameter	Leachate Vault (VLT-01)		
	Pretreatment	Post-Treatment	Pre/Post-Treatment Difference
6:2 Fluorotelomer sulfonate (6:2 FTS)	< 50	< 50	--
8:2 Fluorotelomer sulfonate (8:2 FTS)	< 50	< 50	--
Perfluorobutane sulfonate (PFBS)	8.0	14	--

DRAFT

Parameter	Leachate Vault (VLT-01)		
	Pretreatment	Post-Treatment	Pre/Post-Treatment Difference
Perfluorobutanoic acid (PFBA)	180	**200**	**13**
Perfluorodecane sulfonate (PFDS)	< 5.0	< 5.0	--
Perfluorodecanoic acid (PFDA)	< 5.0	< 5.0	--
Perfluorododecanoic acid (PFDoA / PFDoDA)	< 5.0	< 5.0	--
Perfluoroheptane sulfonate (PFHpS)	< 5.0	< 5.0	--
Perfluoroheptanoic acid (PFHpA)	330	350	15
Perfluorohexane sulfonate (PFHxS)	58	52	--
Perfluorohexanoic acid (PFHxA)	610	630	18
Perfluorononanoic acid (PFNA)	< 5.0	< 5.0	0.0
Perfluorooctane sulfonate (PFOS)	34	31	--
Perfluorooctanesulfonamide (PFOSA / FOSA)	< 5.0	< 5.0	--
Perfluorooctanoic acid (PFOA)	5800	6100	330
Perfluoropentanoic acid (PFPeA)	77	130	57
Perfluorotetradecanoic acid (PFTA / PFTeDA / PFTeA)	< 5.0	< 5.0	--
Perfluorotridecanoic acid (PFTrDA / PFTriA)	< 5.0	< 5.0	--
Perfluoroundecanoic acid (PFUnA / PFUnDA)	< 5.0	< 5.0	--
Total PFAS	7000	**7400**	**410**

Note: Pre- and Post- Difference results are calculated prior to the numbers being rounded following laboratory SOPs using the raw instrument data. After rounding, values reported may not be consistent with the differences calculated from the reported pre- and post-treatment data as reported.

In red = subject to influence via blank detection; either likely false positives or elevated due to potential false positives.

Conclusions

Based on the results of the TOP Assay, it appears that the amounts of chemically-oxidizable precursors present in the samples from the Bennington Landfill are negligible, with the exception of the sample from the leachate vault (VLT-01). While this assay has some limitations, this could indicate that additional concentrations of PFASs seen in the future would not be due to the presence of precursors, provided the vault integrity at the landfill is maintained.

The test results in this report meet all 2003 NELAC and 2009 TNI requirements for accredited parameters, exceptions are noted in this report. This report may not be reproduced except in full, and with written approval from the laboratory. For questions please contact the Project Manager at the e-mail address or telephone number listed on this page.

This report has been electronically signed and authorized by the signatory. Electronic signature is intended to be the legally binding equivalent of a traditionally handwritten signature.

Results relate only to the items tested and the sample(s) as received by the laboratory.

Qualifiers

LCMS

Qualifier	Qualifier Description
*	Isotope Dilution analyte is outside acceptance limits.
*	LCS or LCSD is outside acceptance limits.
B	Compound was found in the blank and sample.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
PQL	Practical Quantitation Limit
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)

Laboratory: TestAmerica Sacramento

Narrative

Job Narrative
320-28599-1

Receipt
The samples were received on 5/26/2017 9:15 AM; the samples arrived in good condition, properly preserved and, where required, on ice. The temperature of the cooler at receipt was 1.4º C.

LCMS
Method(s) 537 (modified): The labeled analyte M2-4:2FTS is employed in this analysis as a "Reverse Surrogate". It is used to monitor the oxidation efficiency of the TOP assay. This compound is fortified into all sample fractions prior to any processing. The recovery of this compound should be close to 100% in Pre-Treatment fractions, as this fraction is not oxidized, and 0% in Post-Treatment fractions, indicating complete oxidation of the sample.

Method(s) 537 (modified): The compound M2-4:2FTS is converted to PFBA during the oxidation step of the TOP assay. The Post-Treatment method blank's PFBA result indicates roughly how much of any field sample's Post-Treatment PFBA result is contributed by the oxidation process.

Method(s) 537 (modified): The Isotope Dilution Analyte (IDA) recovery associated with the following samples is below the method recommended limit for 13C8 FOSA: SG3-MW-7-170524 (320-28599-1), SG3-B-12-170524 (320-28599-2), SG3-B-2-1-170525 (320-28599-4), SG3-B-2-2-170525 (320-28599-5), SG3-VLT-01-170525 (320-28599-6), SG3-FD01-170525 (320-28599-7), (MB 320-168090/1-A) and (MB 320-168333/1-A). Generally, data quality is not considered affected if the IDA signal-to-noise ratio is greater than 10:1, which is achieved for all IDA in the sample. All detection limits are below the lower calibration.

Method(s) 537 (modified): The Isotope Dilution Analyte (IDA) recovery associated with the following sample is below the method recommended limit for 13C4 PFBA and 13C8 FOSA: SG3-FD01-170525 (320-28599-7). Generally, data quality is not considered affected if the IDA signal-to-noise ratio is greater than 10:1, which is achieved for all IDA in the sample. All detection limits are below the lower calibration.

Method(s) 537 (modified): The Isotope Dilution Analyte (IDA) recovery associated with the following samples is below the method recommended limit for several analytes: SG3-MW-100S-170524 (320-28599-3). Generally, data quality is not considered affected if the IDA signal-to-noise ratio is greater than 10:1, which is achieved for all IDA in the samples. All detection limits are below the lower calibration.

Method(s) 537 (modified): The Isotope Dilution Analyte (IDA) recovery associated with the following sample is below the method recommended limit for Perfluorobutanoic acid (PFBA): SG3-VLT-01-170525 (320-28599-6). Generally, data quality is not considered affected if the IDA signal-to-noise ratio is greater than 10:1, which is achieved for all IDA in the sample. All detection limits are below the lower calibration.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

Organic Prep
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

VOA Prep
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

Question	Answer	Comment
Radioactivity wasn't checked or is </= background as measured by a survey meter.	True	
The cooler's custody seal, if present, is intact.	True	
Sample custody seals, if present, are intact.	N/A	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	False	
There are no discrepancies between the containers received and the COC.	True	
Samples are received within Holding Time (excluding tests with immediate HTs)	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	N/A	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
Containers requiring zero headspace have no headspace or bubble is <6mm (1/4").	True	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Residual Chlorine Checked.	N/A

Technical Memorandum

To: Project file
From: Adam Janzen
Subject: SGPP Vermont Slug Test Analysis
Date: December 14, 2017
Project: 45021004.00

Slug testing was conducted at wells SG3-MW17-01, SG3-MW17-02, SG3-MW17-03, SG3-MW17-04, SG3-MW17-06, SG3-MW17-07, and SG3-MW17-WWTP. Falling-head (i.e., slug in) and rising-head (i.e., slug out) tests were initiated at each well using solid slugs of 1-foot and 3-foot lengths constructed from 1.5625-inch-OD plastic pipe filled with concrete. In-Situ LevelTroll 400 pressure transducer/dataloggers were used to monitor water levels at a recording interval of up to 500 milliseconds (i.e., 2 readings per second) in each well during the slug testing. The transducers were suspended in the wells using either fishing line or mason twine. Because viewing the data in real-time was not possible with this configuration, water level recovery during the slug testing was monitored by periodically collecting manual water level measurements with an electric tape (Heron Dipper-T).

The LevelTroll 400 is an absolute transducer, meaning that it measures the sum of barometric pressure and the water pressure above the transducer. Hourly barometric pressure data were collected with an In-Situ BaroTroll located at the Bennington Landfill. Due to the short durations of the slug tests (generally < 1 hour), barometric corrections were not applied to the slug test data.

On several occasions, the position of the transducer in the well was disturbed by slug removal. Data from these tests were not used in the analysis, and, when possible, the affected tests were repeated.

Due to a small water column (approximately 3 feet) and slow recharge rate, a recovery test was conducted at SG3-MW17-05 instead of slug tests. The recovery test procedure consisted of purging the well dry with a peristaltic pump and then monitoring the water level recovery with a LevelTroll 400 transducer at a 1-minute recording interval. Due to the long duration of the recovery at SG3-MW17-05 (approximately 16 hours), pressure readings were corrected for barometric pressure fluctuations using the barometric data collected by the BaroTroll at the landfill.

The slug test data and the SG3-MW17-05 recovery test data were analyzed in AQTESOLV (HydroSOLVE, 2007) using conventional analytical methods to estimate values of hydraulic conductivity. Except where noted below, the Bouwer-Rice (1976) straight-line method was used for all analyses. The analysis for each well is discussed below, followed by plots of the fits to the data:

- SG3-MW17-01. This well is screened across the water table, so only the rising-head tests were analyzed. Filter pack recharge was not observed in the data, so no effective radius correction was applied. Only the data from the tests using the 3' slug were analyzed because insufficient test signal was captured from the 1' slug tests due to rapid water level recovery.

DRAFT

- SG3-MW17-02. This well is screened across the water table, so only the rising-head tests were analyzed. Filter pack recharge was not observed in the data, so no effective radius correction was applied. Extremely rapid water level recovery at this well resulted in no usable signal from the 1′ slug tests and minimal (3-4 data points) signal from the 3′ tests, even at a 500 millisecond recording interval. Analysis was attempted for the 3′ slug tests, though the results should be considered approximate.
- SG3-MW17-03. This well is screened across the water table, so only the rising-head tests were analyzed. Filter pack recharge was observed in the data in the form of the "double straight line effect" (Bouwer, 1989), so an effective radius correction using equation 6.11b from Butler (1998) was applied. As recommended by Butler (1998), the Bouwer-Rice solution was fit to the second (less steep) limb of the double straight line response.
- SG3-MW17-04. This well is not screened across the water table, so both the falling-head and rising-head tests were analyzed. The response curve shapes were slightly concave up instead of straight; the Bouwer-Rice straight-line solution was fit to the approximately linear region between normalized displacement (displacement scaled by the initial displacement) of 0.2-0.3 as recommended by Butler (1998). No rising-head data were available for the 3′ tests at this well due to a combination of transducer disturbance and full transducer memory.
- SG3-MW17-05. The response to the recovery test was approximately linear, so the Bouwer-Rice straight-line solution was fit to the data over the recommended range of 0.2-0.3 normalized displacement.
- SG3-MW17-06. This well is screened across the water table, so only the rising-head tests were analyzed. Filter pack recharge was not observed in the data, so no effective radius correction was applied. Water levels rose slightly during the slug testing at this well; the resulting linear trend was filtered out of the data before proceeding with the analysis. Only the data from the tests using the 3′ slug were analyzed because insufficient test signal was captured from the 1′ slug tests due to rapid water level recovery.
- SG3-MW17-07. This well is not screened across the water table, so both the falling-head and rising-head tests were analyzed. The response curve shapes were slightly concave up instead of straight; the Bouwer-Rice straight-line solution was fit to the approximately linear region over the recommended normalized displacement range of 0.2-0.3.
- SG3-MW17-WWTP. This well is not screened across the water table, so both the falling-head and rising-head tests were analyzed. The response to this test was clearly not linear, so the Bouwer-Rice solution was not applicable. Instead, the data from this well were analyzed using the Kansas Geological Survey model (Hyder et at., 1994). Only one rising-head was available for this well due to transducer disturbance issues.

Technical Memorandum

To: Project file
From: Evan Christianson and Adam Janzen
Subject: SGPP Vermont Grain Size Analysis
Date: December 14, 2017
Project: 45021004.00

Hydraulic conductivity estimates were derived from analysis of grain size data. Such analyses use empirical equations that relate hydraulic conductivity to various combinations of grain size dimensions, porosity, and fluid properties. Three of these methods were used in this study:

- Hazen (1911). This simple method estimates hydraulic conductivity as the square of d_{10}, the grain size diameter for which 10% (by weight) of the soil particles are smaller and 90% are larger.
- Kozeny-Carmen (1937). This method incorporates fluid properties (specific weight and viscosity), porosity, a shape factor, an empirical coefficient, and the specific surface area. This study assumed a specific weight of 0.009789 N/cm^3, a viscosity of 1.0e-7 N*s/cm^2, a porosity of 0.3, and a shape factor of 6.0. The specific surface area was estimated from grain size dimensions using the method of Carrier (2003).
- Barr (2001). This method modifies the Kozeny-Carmen equation to use a hydraulic radius calculated from the porosity and surface area of the porous medium instead of the specific surface area. The Barr method uses a different shape factor (assumed to be 1.1). The same values as above were assumed for the fluid specific weight, fluid viscosity, and porosity.

These empirical methods provide rough, screening-level estimates of hydraulic conductivity and one method is not clearly superior to another. Therefore, for the purposes of this study all three methods were used to estimate hydraulic conductivity from the grain-size distributions. In the main body of the report, the hydraulic conductivity estimates for each sample are presented as a composite of all three methods.

This memo is followed by a table and plots of the grain size distributions for each sample. A full table of hydraulic conductivity estimates for each sample and method is included in Appendix G.4.

DRAFT

Appendix H

Preliminary Evaluation of Other Potential PFAS Sources

DRAFT

December 14, 2017 Project No.: 177-8327

RE: PRELIMINARY EVALUATION TO IDENTIFY POTENTIAL PFAS SOURCES IN CORRECTIVE ACTION AREAS I AND II
SAINT-GOBAIN PERFORMANCE PLASTICS
BENNINGTON, VERMONT
VT DEC SITE #199712055

Golder Associates Inc. (Golder), on behalf of Saint-Gobain Performance Plastics (SGPP), has performed a preliminary desktop evaluation to identify potential sources of per- and polyfluoroalkyl substances (PFAS) in Corrective Action Areas I and II (CAAI and CAAII) in Bennington, Vermont. Golder's initial review of CAAI and CAAII groundwater analytical data and current and historical property uses in the area indicates that there are multiple sources of PFAS contributing to the concentrations of PFAS measured in soil and groundwater in the study areas. This evaluation may be updated as additional data become available.

1.0 BACKGROUND

In 2000, SGPP acquired Chemfab, a manufacturer of high-performance plastic products. Historically, Chemfab operated at two locations in the Bennington, Vermont area over a period of approximately 33 years: the Northside Drive facility in the Town of Bennington (from 1969 to 1978), and the Water Street facility in the Village of North Bennington (1978 to 2002). Operations at the former Chemfab facilities included the application of polytetrafluoroethylene (PTFE) coatings to some fiberglass fabrics. During the process of drying/curing the PTFE, perfluorooctanoic acid (PFOA) may have been emitted from the facilities' stacks. PFOA is understood to be the only PFAS compound in the air emissions from the former Chemfab facilities.

Two areas of investigation have been established as part of the on-going PFAS hydrogeological investigation in the Bennington, Vermont area:

- Corrective Action Area I (CAAI), which generally consists of a bounded area west of Route 7.
- Corrective Action Area II (CAAII), which generally consists of a bounded area east of Route 7.

2.0 POTENTIAL PFAS SOURCES

PFAS have been widely used in industry and consumer products resulting in many potential sources. The following provides a summary of known uses and applications for PFAS, which may have occurred in the Bennington area.

2.1 Surface Treatments

PFAS were used to impart grease, oil, and/or water resistance to various products; industries known to have used PFAS compounds for surface treatments include:

- Carpet manufacturers and fiber producers for residential, commercial, and transportation flooring (3M, 1999)
- Manufacturers of upholstery fabric for residential furniture, home decor items such as slipcovers, mattress pads and shower curtains, and automotive, truck and van interiors (3M, 1999)
- Textile mills, leather tanneries, finishers and chemical formulators who treat fabric and leather used for garments, footwear, accessories and non-garment functional fabrics (3M, 1999)

Golder Associates: Operations in Africa, Asia, Australasia, Europe, North America and South America

Golder, Golder Associates and the GA globe design are trademarks of Golder Associates Corporation

- Paper mills and packaging companies which treat paper and/or paperboard to impart grease, oil, and/or water resistance to paper products for:
  - Food contact applications (e.g., plates, food containers, bags, or wraps) and
  - Non-food contact applications (e.g., folding cartons, carbonless forms). (3M, 1999)
- Carpet cleaning operations, which use PFAS-containing carpet/upholstery cleaning solutions, stain protectants and water-resistant solutions. 3M supplied a carpet spot cleaner to consumers in pump and aerosol cans (3M, 1999).
- Granite, stone, and tile finishing operations, which used PFAS-containing sealants for granite, stone and tile sealing/finishing (3M, 1999), and potentially in the wet saw process (NJDEP, 2015). PFAS were detected in connection with stone finishing operations in the following studies:
  - Sealing materials for granite, stone, and tile were sampled as part of an EPA study. PFOA was detected in the 400-800 nanograms per gram (ng/g) range for both samples. (EPA, 2009)
  - NJDEP has been investigating sources of PFAS to the Metedeconk River watershed (NJDEP, 2015). As part of the NJDEP study, PFAS were detected in stormwater associated with an "illicit discharge from a granite countertop manufacturer."
- Painting and coating operations. The following references indicate that PFAS (fluorinated surfactants) are known additives in paints and other coatings:
  - "Fluorinated surfactants impart valuable properties to paints and coatings" (Knepper and Langue, 2012)
  - "Fluoro-surfactants are useful additives in solving low-VOC coating-related problems in architectural coatings, such as anti-crater, anti-block and shorter open times in addition to their traditional role as wetting agents" (Meng, 2007)

The types of facilities where PFAS-containing surface treatments may have been used or stored include:

- Carpet manufacturing, treatment, or cleaning facilities
- Furniture upholstery manufacturing, treatment, or cleaning facilities
- Dry cleaners
- Paper mills
- Stone and tile manufacture, fabrication, or cleaning facilities
- Residences where cleaning, stain guarding, and/or waterproofing of carpets, upholstery, fabrics, granite countertops, stone, and/or tile occurred

2.2 Surfactants or Wetting Agents

Because of their exceptional capacity for lowering surface tension, PFAS were used in a number of products or processes as surfactants, emulsifiers, and/or wetting agents, including:

- Electronics: PFAS were used as wetting agents and surfactants in solders for electronic parts and cleaning of electronic components (Kissa, 2001)
- Chrome plating: PFAS were used as a mist suppressant in chrome plating processes (3M, 1999)
- Car washes: "Fluorinated surfactants in automotive waxes aid spreading and improve the resistance of the polish to water and oil. Fluorinated surfactants are used in other car-care

DRAFT

products as well: in cleaners for spray washing automobiles… and shampoos for fabrics and vinyl surfaces" (Kissa, 2001)

- Herbicides/Pesticides: PFAS were used as wetting agents for herbicide and pesticide applications (Kissa, 2001)
- Mining and Oil Extraction: PFAS were used as surfactants for mining and oil extraction processes (3M, 1999)
- Fire Suppression: PFAS were potentially used as wetting agents for Class A fires (see Fire Fighting Foam below)

Types of facilities where PFAS surfactants may have been used or stored include:

- Electronics manufacturing or recycling facilities
- Chrome plating facilities
- Car washes
- Facilities with pesticide and herbicide use or storage
- Fire stations

2.3 Fire Fighting Foam

PFAS were used to manufacture Aqueous Film Forming Foam (AFFF) until 2001. AFFF based on perfluorooctane sulfonic acid (PFOS) was used to extinguish Class B flammable liquid fires (EPA, 2014). In addition, AFFF was used to suppress vapors at hazardous/flammable liquid spills (USEPA, 1986) and potentially as a wetting agent for Class A fires (National Foam, 1999; NFPA, 2010; Angus Fire, 2016). "AFFF produced after 2002 may also contain PFOA and/or precursor PFC/PFAS, which can degrade to PFOA." (NYSDEC, undated). Example sites where AFFF may have been used or stored include:

- Fire stations,
- Airports,
- Hangars,
- Fire or emergency response sites or training sites where AFFF was applied, or
- Companies who install or maintain AFFF systems associated with the above.

2.4 Wastewater Treatment and Biosolids

Because of their ubiquity in consumer products (i.e., cleaning products, food wrappers/containers, Teflon®-coated housewares, etc.), PFAS are present in wastewater treatment plant (WWTP) influent, effluent, and sludge (biosolids) (Schultz et al., 2006; Guerra et al., 2014). WWTP processes can also increase mass of some PFAS through conversion of precursors present in the influent (Schultz et al., 2006; Guerra et al., 2014).

Biosolids from the wastewater treatment process are known to contain PFAS (Sepulvado et al., 2011). PFOS was present in biosolids-amended soils, at concentrations between 2 and 11 ng/g in plots amended for 3 years, and at up to 483 ng/g in longer term plots. Sepulvado et. al. estimated that application rates of 44 to 178 mega grams per hectare (Mg/ha) would result in pore water concentrations over 200 nanograms of per liter (ng/l, equivalent to ppt) of PFOS and over 400 ng/l (ppt) for PFOA.

Biosolids are known to have been land-applied for the following beneficial re-uses (NEBRA, 2014):

- Agriculture (including feed corn for livestock, hay fields, and pasture)
- Forestry

DRAFT

- Land reclamation (including gravel pits/surface mines)
- Horticulture/landscaping
- Turf farms
- Athletic fields (including golf courses)
- Highways (constructed wetlands and wildflower cultivation along highways)

Land uses potentially associated with biosolids application include:

- Agricultural fields
- Athletic fields
- Turf farms
- Landscaped areas
- Greenhouses
- Nurseries
- Landscaping and topsoil supply facilities

2.5 Landfills

Wastes disposed of in landfills and dumps typically contain consumer and commercial goods that have varying amounts of PFAS, such as treated carpeting, fast-food wrapping, floor wax, composted materials, WWTP sludge, dyes, textiles, tape, batteries, and furniture (Schaider et al., 2017). In addition, landfills and dumps may have received wastes from specific industries like those described above that can contain PFAS. Leachate generated from the waste materials can result in impacts to soil and groundwater.

2.6 Other Uses

Other applications, industries, or products known to use/contain PFAS include:

- Fluoropolymer application (e.g., application of Teflon® coating).
- Aviation hydraulic fluids, to which PFAS were added as an anti-erosion additive (Boeing, 2002).
- Photographic films, in which PFAS were used to reduce static buildup during manufacture and use, as well as during photofinishing processes (Knepper and Langue, 2012).
- Printing Inks, in which PFAS were used to aid wetting and pigment dispersion, especially for “difficult-to-wet” surfaces (e.g. plastics and metals). PFAS were also added to ballpoint pens, marking pens (Kissa, 2001), and ink jet printers (Knepper and Langue, 2012).
- The insecticide sulfluramid (N-ethyl perfluorooctancesulfonamide), which is known to degrade to form PFOS (Knepper and Langue, 2012).

3.0 PRELIMINARY IDENTIFICATION OF POTENTIAL SOURCES IN CAAI AND CAAII

For this preliminary evaluation of potential sources of PFAS in the study area, Golder first reviewed available PFAS groundwater results in CAAI and CAAII, to identify areas where PFAS sampling results are inconsistent with the former Chemfab facility air emissions fingerprint. Specifically, Golder focused on areas where in addition to PFOA, one or more sulfonate compounds (e.g., PFOS, perfluorobutane sulfonate [PFBS], and/or perfluorohexane sulfonate [PFHxS]; collectively, a sulfonate signature) were also detected in groundwater. Golder then performed a desktop review of potential industrial and commercial users of PFAS in the areas where one or more sulfonate compounds have been detected in groundwater.

DRAFT

Additionally, Golder performed a broader desktop review of Bennington's industrial footprint, to identify operations that are generally known to use PFAS in manufacturing or other processes (as described in Section 2). This evaluation does not include discussion of the Bennington Landfill, which has already been identified as generating PFAS-containing leachate. Nor does this evaluation include the most recent data collected as part of the on-going Conceptual Site Model Site Investigation (CSM SI). This evaluation may be updated when the CSM SI is completed.

The following sections summarize potential PFAS sources identified by Golder during this preliminary evaluation.

3.1 Potential PFAS Sources in Corrective Action Area I

Figure 1 illustrates locations where a sulfonate signature (PFOS, PFBS, and/or PFHxS) has been detected in groundwater, which is inconsistent with the air emission source, and/or locations where a specific commercial/industrial facility (e.g., wastewater treatment plants, landfills) represents a potential PFAS source. In CAAI, Golder focused on five of these areas to identify potential PFAS sources as illustrated on Figure 1. Figure 2 identifies properties/facilities within these areas that represent potential PFAS sources. During its desktop evaluation, Golder identified other properties and facilities in CAAI outside of the focus areas that also represent potential PFAS sources. SGPP has yet to fully evaluate/research these properties/facilities.

3.1.1 Water Street Area

Water Street is located in the Paran Creek valley and extends south from the North Bennington village toward the Walloomsac River. Water Street is an area of focus because it is a developed area with a mixture of industrial and residential properties, with agricultural fields at the northern end of the street (see Figures 1 and 2); the former Chemfab facility is located at the southern end of Water Street. Industrial development in this area dates back to at least the early 1900s.

Potential sources of PFAS in the Water Street area include:

- ADC Optical Systems (ADC), located at 441 Water Street (north of the former Chemfab facility), reported fluoropolymer and thermoplastic pellets on their 2011 Tier II Chemical Inventory. ADC was a manufacturer of electronic connectors (i.e., cables/wire); according to the Vermont Secretary of State Corporations Divisions website, ADC may have operated from 2004 through 2011. Prior to ADC Optical Systems, this property was occupied by fiber optic cable manufacturer Northern Lights Cable, Inc., Furon (a plastics manufacturer specializing in high performance insulation products), and the PRO-FAB machine shop. TE Connectivity, another manufacturer of fiber optic cable, occupied the property as recently as 2014.

  The property was initially developed to operate as a furniture finishing facility, and was operated by the H.T. Cushman Company and Green Mountain Furniture prior to 1977. Paints and other coatings may contain PFAS (Knepper and Langue, 2012).

- Polygraphic Company of America (PCA), and later Garrison Printing Division (GPD), was formerly located at 940 Water Street and operated as a lithographic printing company from 1937 to the early 1970s (Lincoln Applied Geology, 2002; VTDEC, 2011; Sanborn Maps, 1921, 1928, 1941,and 1959). Prior to 1937, the property was occupied by the H.C. White Company, which manufactured stereoscopes and children's toys and furniture. PFAS are known to have been used in printing inks to aid in wetting and pigment dispersion, to reduce static buildup during the manufacture of photographic films, and during photo-finishing processes. Paints and other coatings may contain PFAS.

  An Environmental Site Investigation and Remedial Activity report (The Johnson Company, 1996) indicates that an incinerator was formerly located on the property, between the site building and Paran Creek. The history of operation and types of wastes potentially incinerated are unknown; however, because materials used at the property may have

DRAFT

contained PFAS (e.g., inks, films, etc.) and many consumer products contain PFAS, the incinerator represents a potential PFAS emission source.

- Allen's Cleaning Service and SNJ Janitorial Services were formerly located at 713 and 889 Water Street, respectively. Many consumer cleaning and stain-guard products are known to contain PFAS.
- Agricultural fields at the northern end of Water Street may have been treated with herbicides or pesticides. In addition, biosolids may have been applied to these areas. Herbicides, pesticides, and biosolids are known to contain PFAS.

Numerous other businesses are currently or were previously located along Water Street, including: Bennington Leather, Bouchard Steel Erectors, National Hanger Company, and Slade Glass Specialists. However, the operations associated with these business and/or their historical locations are not known at this time.

3.1.2 North Bennington Road/Murphy Road Area

The North Bennington Road/Murphy Road area is approximately 0.7 miles east of the former Chemfab facility and extends to the north along Matteson Road (see Figures 1 and 2). This area is developed with a mix of residential, commercial, and industrial properties. Additionally, there are extensive agricultural fields to the south of North Bennington Road, and Bennington College is located north of North Bennington Road.

The following sulfonates, which are not consistent with the former Chemfab facility air emissions, were detected in groundwater at the intersection of North Bennington Road and Murphy Road:

- up to 58 ppt PFOS
- up to 25 ppt PFBS
- up to 2.3 ppt PFHxS

Potential sources of PFAS in the North Bennington Road/Murphy Road area include:

- The Vermont Tissue Company, formerly located at 1514 North Bennington Road, produced various paper products from 1900 to 1940, and produced tissue paper from 1940 to 1986; paper cutting operations continued at the property until 2006 (NUS Corporation, 1990). Printed paper for the floral industry was also reportedly produced on a limit basis (dates unknown), and virgin inks were among hazardous materials characterized and disposed of during remedial activities at the property (VTDEC, 2012).

  The paper mill building is located on the south site of North Bennington Road and abuts the Walloomsac River. Three warehouses, a storage building, an office building, and two lagoons were located north of North Bennington Road. The lagoons were constructed in the early- to mid-1960s, and received wastewater from the paper-making process. Reportedly, Vermont Tissue had a permit for discharge to the Bennington Wastewater Treatment Plant for approximately 1.5 years in the early 1970s, but eventually resumed discharge to the lagoons. At least two "overflow" events were noted, in which sludge from the lagoons broke through the lagoon berms and drained into a nearby swamp and small stream. All discharge was reportedly discontinued in 1986.

  In addition, an interview with a former employee of the mill (from 1940 to 1956) documented that "it was customary practice during his employment to dump drums of waste caustic, soda ash and other waste products on the ground surface throughout the site," (URS, 2007). Aerial photographs of the northern portion of this property dating from 1942 to 1951 show areas of disturbed soils or stockpiled materials. These disturbed areas may have received waste prior to the development of the warehouses (mid-1950's) and lagoons. The

DRAFT

interview also notes that wastewater from paper making was primarily discharged to the Walloomsac River.

The paper mill building portion of the property is currently operated as a distillery and hydro-electric dam, and is under separate ownership from the northern portion of the former Vermont Tissue property (i.e., the former storage buildings and lagoons). A 2011 draft Corrective Action Plan (CAP) for the northern property indicates the preferred remedial outcome for the lagoons was capping (The Johnson Company, 2011); however, it is unclear whether this work was completed. Consistent with information provided during the former employee's interview, the CAP notes miscellaneous debris throughout the northern property.

Paper mills are known to have used/stored PFAS-containing material for imparting grease, oil, or water resistance to paper products. Additionally, PFAS are known to have been used in printing inks to aid in wetting and pigment dispersion. Recently, the New York State Department of Environmental Conservation (NYSDEC) and New York State Department of Health (NYSDOH) discovered the presence of six PFAS compounds, including PFOA and PFOS, in paper mill sludge as well as in the sludge facility's groundwater monitoring well and storm water collection pond (NYSDOH, 2017).

The highest concentration of PFOS (58 ng/l) in the North Bennington Road/Murphy Road area was detected at a residential well located between the mill building and the lagoons to the north.

- Three automotive repair businesses: Art's Body Shop, K&D Autobody (formerly Prouty's Automotive), and Walt Smith's. Car care products such as automotive waxes, spray wash cleaners, and shampoos for fabrics and vinyl surfaces are known to contain fluorinated surfactants. In addition, PFAS are used in certain under-hood wiring and components to make them heat and fluid resistant (OECD, 2013).
- A private residence located at 1360 North Bennington Road appears to have a greenhouse-like structure in the southeastern corner of the property. Herbicides, pesticides, and/or biosolids may have been used at this property. In addition, sampling results at this location report one of the highest concentrations of PFBS in the North Bennington Road/Murphy Road area. Concentrations of PFBS in this area decrease to the west of this property.
- Areas of disturbance identified in historical aerial photographs of Bennington College campus may represent areas formerly used for landfilling. In addition, the Burlington Free Press indicated in their April 23, 1988 edition that a landfill located "east of the [Bennington] college maintenance building [had] been used to dump construction debris and brush" and that the college "dumped construction materials from a renovation project there after the Bennington landfill closed." PFAS are often detected in landfill leachate and groundwater, and based on the use of PFAS in building materials (e.g., paints, coatings, and wire casing), it is reasonable to assume that PFAS would be present in construction and demolition debris landfills.
- Agricultural fields located south of North Bennington Road may have been treated with herbicides or pesticides. In addition, biosolids may have been applied to these areas. Herbicides, pesticides, and biosolids are known to contain PFAS.

3.1.3 Harrington Road/Murphy Road Area

This area is located on Harrington Road and Murphy Road, approximately 0.6 miles west of the former Chemfab facility. A sulfonate signature was detected in the southern part of this area along Murphy Road, and the Bennington WWTP is located in the northern part of this area on Harrington Road. Groundwater sampling results in the Harrington Road/Murphy Road area include detections of the following sulfonates:

- up to 56 ppt PFOS

DRAFT

- up to 15 ppt PFBS

Potential sources of PFAS in the vicinity of Harrington Road/Murphy Road include:

- The Town of Bennington WWTP. As previously noted, PFAS are known to often be present in WWTP influent, effluent, and sludge, and WWTP processes can increase the mass of some PFAS through conversion of precursors present in the influent.
- Pembroke landscaping is located immediately south of the WWTP on Harrington Road. Landscaping facilities may use or store biosolids-containing soil amendments, herbicides, and/or pesticides. Biosolids, herbicides, and pesticides are known to contain PFAS.
- Agricultural fields are present along the length of Harrington Road. Biosolids, herbicides, and/or pesticides may have been applied to these fields.

3.1.4 Gypsy Lane Area

Gypsy Lane is located approximately 2.3 miles south of the former Chemfab facility and includes a portion of CAAII. This area is a mix of residential and commercial development, with agricultural fields to the south and west. A sulfonate signature was detected along Jennings Drive to the south and Walloomsac Road to the north. Groundwater sampling results in the Gypsy Lane area include detections of the following sulfonates:

- up to 6.7 ppt PFOS
- up to 23 ppt PFBS

Potential sources of PFAS in the vicinity of Gypsy Lane include:

- Bennington Rural Fire Station, located at 900 West Road, south of Gypsy Lane. PFAS are used in the manufacture of AFFF, which is used to extinguish Class B fires, suppress vapors at hazardous/flammable liquid spills, and potentially as a wetting agent for Class A fires. AFFF may have been used or stored at the fire station.
- Agricultural fields are present to the south and west of the Gypsy Lane area. Biosolids, herbicides, and/or pesticides may have been applied to these fields.

3.1.5 Vail Road/Bard Road Area

The Vail Road/Bard Road area is located approximately 1 mile south of the former Chemfab facility. A sulfonate signature was detected along Bard Road, Red Pine Road, and Vail Road in this area. Groundwater sampling results in the Vail Road/Bard Road area include detections of the following sulfonates:

- up to 130 ppt PFOS
- up to 12 ppt PFBS

Potential sources of PFAS in the Vail Road/Bard Road area include:

- James A Dulin Restorations, located at 100 Bard Road. It is unclear what sort of restorations were performed; however, as previously noted, constructions materials, various paints, coatings, and surface treatments, and other surface treatments are known to contain PFAS.
- Proutys Service Station was located in the southwestern portion of this area, on Airport Road. Car care products such as automotive waxes, spray wash cleaners, and shampoos for fabrics and vinyl surfaces are known to contain fluorinated surfactants. In addition,

DRAFT

PFAS are used in certain under-hood wiring and components to make them heat and fluid resistant.

- Greenhouses were formerly located in the eastern portion of this area on Vail Road, and current agricultural fields are present in the southwestern portion of this area, south of Vail Road. Additionally, historical aerial photographs indicate that the eastern portion of this area, and lands to the south, were formerly used more extensively for agriculture. Biosolids, herbicides, and/or pesticides may have been used in the greenhouse operations, or applied to agricultural fields.

3.2 Corrective Action Area II (CAAII)

The lines of evidence supporting the presence of potential sources of PFAS in the CAAII vicinity are summarized below for twelve areas of interest identified by Golder. Areas of interest were identified based on the presence of the sulfonate signature, or the presence of industries known or suspected to use PFAS in manufacturing or other processes. SGPP has yet to fully evaluate/research these properties/facilities.

3.2.1 Willow Road/East Road Area

The intersection of Willow Road and East Road is located approximately 2.9 miles east of the Saint-Gobain former Chemfab facility, beyond the modeled extent of air deposition from the former Chemfab facility that would result in the measured PFOA groundwater concentrations at or above 20 ppt. This area is a mixture of commercial and residential development. The following sulfonates were detected in groundwater near the intersection of Willow Road and East Road:

- up to 13 ppt PFOS
- up to 6.2 ppt PFHxS
- up to 3.1 ppt PFBS

Potential sources of PFAS in the vicinity of Willow Road and East Road include:

- LeBlanc's Auto Recycling, an approximately 3 acre Tier IV auto salvage yard (i.e., a facility permitted to accept vehicles for parts and dismantling, and conduct vehicle crushing on site) and auto repair facility, is located at 37 Willow Road. LeBlanc's Auto Recycling has used this location as a storage lot since 1962, and consolidated their operations to this location in 1973. Car care products such as automotive waxes, spray wash cleaners, and shampoos for fabrics and vinyl surfaces are known to contain fluorinated surfactants. In addition, PFAS are used in certain under-hood wiring and components to make them heat and fluid resistant. Storage, handling and/or disposal of these products/materials (or vehicles that have been treated with them) in an exposed outdoor environment can cause PFAS impacts to soil and/or groundwater.

  The sulfonate signature compounds were detected in groundwater immediately south of this facility.

- Badson's Auto, an automotive repair center, is located at 1323 East Road. PFAS-containing car-care products or parts may have been used or stored at this location.

3.2.2 Chapel Mobile Home Park Area

The Chapel Mobile Home Park area is located on Chapel Road approximately 3.6 miles east of the former Chemfab facility. The area is predominantly residential development, with potential agricultural development to the west, and an unknown commercial or industrial building in the eastern portion of the area. The following sulfonates were detected in groundwater in the Chapel Mobil Home Park area:

- up to 28 ppt PFOS

DRAFT

- up to 3.7 ppt PFHxS
- up to 3.5 ppt PFBS

Potential sources of PFAS in the vicinity of the Chapel Mobile Home Park area include:

- A potential agricultural field to the west of Chapel Road. Biosolids, herbicides, and/or pesticides may have been applied to these fields.
- Carrol's Offset Camera was formerly located adjacent to the mobile home park. A small camera business operated at this location from 1972 to 1992. PFAS are known to have been used in the manufacture and use of photographic films, as well as during photo-finishing processes. Golder did not review information regarding chemical disposal associated with this business.
- Recent aerial photography of the Chapel Mobile Home Park area shows the presence of a large building with small equipment and debris stored, handled, and/or disposed of in the wooded area immediately to the east of the mobile home park. Many consumer products contain PFAS and storage, handling and/or disposal of these products in an exposed/outdoor environment, even in small concentrations, can cause PFAS impacts to soil and/or groundwater.
- The Chapel Mobile Home Park sewage system is of unknown age and condition. Neighboring East Mountain Mobile Home Park (located to the east) is reported to have had a formal administrative enforcement action with respect to the Safe Drinking Water Act (SWDA) in 2010; the nature of the administrative enforcement action is unknown. Because many consumer products contain PFAS, a past or present failure of community septic systems may result in the release of PFAS to the environment.

3.2.3 Harwood Hill Road Area

Harwood Hill Road is a north-south trending road located approximately 2 miles east of the former Chemfab facility. The area is a mixture of commercial and residential development, with agricultural fields present in the northern and southern portions of this area. The ground surface in the vicinity of Harwood Hill Road slopes from north to south, and surface water and shallow groundwater flow are assumed to follow the local topography.

The PFOA concentrations detected in groundwater along Harwood Hill Road are inconsistent with lower PFOA concentrations detected immediately to the west (i.e., along Settlers Road, Springhill Road, and Rice Lane), which are located closer to the former Chemfab facility. The following sulfonates were detected in groundwater in the Harwood Hill Road area:

- up to 8.1 ppt PFOS
- up to 7.3 ppt PFHxS
- up to 60 ppt PFBS

Potential sources of PFAS in the Harwood Hill Road area (i.e., between Beaudoin Lane to the north and Houghton Lane to the south) include:

- Bennington House of Tile and Carpet, a flooring services business located at 1267 Harwood Hill Road. PFAS are known to have been used in carpet cleaning solutions, and stain protectants and water resistant solutions applied to carpet and other flooring materials. Additionally, PFAS is also known to have been used in stone and tile sealants.
- Several agricultural fields are located along Harwood Hill Road, including an orchard at the intersection of Harwood Hill Road and Houghton Lane to the south, and a commercial

DRAFT

farming operation across from Beaudoin Lane to the north. Biosolids, herbicides, and/or pesticides may have been applied to these fields.

- Recent aerial photography of 24 Settlers Road shows the presence of stockpiles of debris stored, handled, and/or disposed of in the yard surrounding the residence on this property (see Exhibit 8, Attachment A). Many consumer products contain PFAS, and construction materials and demolition debris are also known sources of PFAS. Storage, handling and/or disposal of even small quantities of these products/materials in an exposed outdoor environment can cause PFAS impacts to soil and/or groundwater at the concentrations observed.
- Sunset Farm Mobile Home Park, located at 1869 Harwood Hill Road and just north of this area, has a history of sewage system failure. Many consumer products contain PFAS, and faulty septic systems may represent a source of PFAS in the environment.
- Bennington Furniture, a furniture sales business, is located at 1371 Harwood Hill Road. PFAS are known to be present in certain products used to impart stain-resistant qualities to upholstery fabrics, and may be present in paints or other coatings.
- Vermont Roofing Company is located at 1325 Harwood Hill Road. Construction materials and demolition debris are also known sources of PFAS.

3.2.4 Chapel Road/Bradley Drive Area

The Chapel Road/Bradley Drive area is located approximately 3.6 miles southeast of the former Chemfab facility, and is a mixture of commercial and residential development. A sulfonate signature was detected in the northern portion of this area. Additionally, the concentrations of PFOA observed in groundwater at 311 Chapel Road are higher than PFOA concentrations in groundwater observed to the north and west along Chapel Road, Carpenter Lane, Willow Road, and East Road. The following sulfonates were detected in groundwater in the Chapel Road/Bradley Drive area:

- up to 4.8 ppt PFOS
- up to 2.3 ppt PFBS

Potential sources of PFAS in the vicinity of the Chapel Road/Bradley Drive area include:

- B&J Enterprises, a Tier IV auto salvage yard (i.e., a facility permitted to accept vehicles for parts and dismantling, and conduct vehicle crushing on site) is located at 471 Chapel Road. B&J Enterprises has operated at this location since 2009. Car care products such as automotive waxes, spray wash cleaners, and shampoos for fabrics and vinyl surfaces are known to contain fluorinated surfactants. In addition, PFAS are used in certain under-hood wiring and components to make them heat and fluid resistant. Storage, handling and/or disposal of these products/materials (or vehicles that have been treated with them) in an exposed outdoor environment can cause PFAS impacts to soil and/or groundwater.
- Shane's Carpets, a flooring contractor business, is located at 36 Chapel Road. Recent aerial photography of the property shows the presence of a large storage building adjacent to the residence. PFAS are known to have been used in carpet cleaning solutions, and stain protectants and water resistant solutions applied to carpet and other flooring materials.
- Kim's Cleaning Service is located at 161 Laura Lane, off Bradley Drive. Many consumer cleaning and stain-guard products are known to contain PFAS.

Several other small businesses, including Cutler's Creations Taxidermy and S&S Fence Company, are currently or were formerly located in this area. It is unknown if PFAS-containing materials were used or stored as part of their operations. In addition, this area is adjacent to the Kocher Drive/Shields Drive/East Road industrial area, discussed further below.

DRAFT

3.2.5 Jacks Drive/Walts Way Area

The Jacks Drive/Walts Way area is located approximately 3.5 miles east of the former Chemfab facility. This area is predominantly residential development, with potential agricultural development in the southern portion of the area. A sulfonate signature was detected at two residential wells in this area. The following sulfonates were detected in groundwater in the Jacks Drive/Walts Way area:

- up to 4.8 ppt PFOS
- up to 3.2 ppt PFHxS
- up to 5.0 ppt PFBS

Potential sources of PFAS in the vicinity of the Jacks Drive/Walts Way area include:

- Several apparent agricultural fields are located to the south of Jacks Drive/Walts Way area. Biosolids, herbicides, and/or pesticides may have been applied to these fields.
- Recent aerial photography of 1936 Chapel Road (west of Jacks Drive/Walts Way) shows the presence of two large sheds and small equipment and debris stored, handled, and/or disposed of in the backyard of this property. Many consumer products contain PFAS and storage, handling and/or disposal of these products in even small quantities in an exposed/outdoor environment can cause PFAS impacts to soil and/or groundwater.
- An area of disturbed soils in the western portion of this area is apparent in recent aerial photography, and dates back to at least the early 1990s. The purpose/use of this area is unknown.

3.2.6 East Road/Chapel Road Area

The East Road/Chapel Road area is located approximately 3.5 miles northeast of the former Chemfab facility, and is predominantly a residential area. A sulfonate signature is detected along Chapel Road in this area. The following sulfonates were detected in groundwater in the East Road/Chapel Road area:

- up to 6.0 ppt PFOS
- up to 4.3 ppt PFBS

Potential sources of PFAS in the vicinity of the East Road/Chapel Road area include:

- Greenland Custom Embroidery, which specializes in custom embroiders, screen printing, and applique, is located at 72 Outwater Road, off of East Road. Stain-resistant fabrics are offered in their online catalog. It is unknown whether PFAS compounds are associated with screen printing processes.
- J&H Windows, a window cleaning service, located at 2761 Chapel Road. Many consumer cleaning and stain-guard products are known to contain PFAS.
- Several residential properties along Chapel Road appear to have extensive outdoor storage areas in recent aerial photography. Many consumer products contain PFAS and storage, handling, and/or disposal of these products in even small quantities in an exposed/outdoor environment can cause PFAS impacts to soil and/or groundwater.

3.2.7 Overlea Road Area

The Overlea Road area is located approximately 1.5 miles northeast of the former Chemfab facility, and is predominantly a residential development, with areas of potential agricultural use in the middle/northern portion of the area. PFOS was detected in groundwater at concentrations up to 4.1 ppt in the Overlea Road area.

DRAFT

Potential sources of PFAS in the vicinity of the Overlea Road area include:

- Davison Painters formerly operated on Overlea Road (location approximate). Certain paints and coatings are known to contain PFAS.
- Several apparent agricultural fields are located to the north of Overlea Road. Biosolids, herbicides, and/or pesticides may have been applied to these fields.
- Railroad tracks cross Overlea Road east of Matts Drive; railroad maintenance is known to include spraying of herbicides to clear vegetation from the vicinity of the tracks.
- Ken Corey & Son, a construction/development business, is located at the end of Corey Acres. The property includes a large storage building that may house construction equipment and materials. Many consumer products contain PFAS, and construction materials and demolition debris are also known sources of PFAS. Storage, handling and/or disposal of even small quantities of these products/materials in an exposed outdoor environment can cause PFAS impacts to soil and/or groundwater at the concentrations observed.
- J & M Trucking was formerly located at 675 Overlea Road, and recent aerial photography shows multiple vehicles, small equipment, and/or debris stored on this property. Many consumer products contain PFAS. Storage, handling and/or disposal of these products/materials in an exposed outdoor environment can cause PFAS impacts to soil and/or groundwater.
- Bob's Carpet Service was formerly located in the southwestern portion of this area on Matteson Road. PFAS are known to have been used in carpet cleaning solutions, and stain protectants and water resistant solutions applied to carpet and other flooring materials.

3.2.8 Houghton Lane/Apple Hill Road

The Houghton Lane/Apple Hill Road area is located approximately 2.2 miles east of the former Chemfab facility, and immediately south/southwest of the Bennington Landfill. The area is predominantly residential, with agricultural fields to the south and west of this area. A sulfonate signature is detected at multiple locations in this area. The following sulfonates were detected in groundwater in the Houghton Lane/Apple Hill Road area:

- up to 12 ppt PFOS
- up to 2.8 ppt PFHxS
- up to 4.1 ppt PFBS

Potential sources of PFAS in the vicinity of the Houghton Lane/Apple Hill Road area include:

- The Houghton Lane/Apple Hill Road area is located southwest, and potentially hydraulically downgradient, of the Bennington Landfill. The Bennington Landfill received commercial and industrial waste prior to its closure in 1987, and PFOA and PFOS have been detected in groundwater and leachate at the landfill.
- Agricultural fields are located south and west of the Houghton Lane/Apple Hill Road area. Biosolids, herbicides, and/or pesticides may have been applied to these fields.
- Several residential properties in this area are associated with construction/contractor businesses (Bates Builders, JTG Construction, and Carroll Construction). Construction materials and demolition debris are also known sources of PFAS.

DRAFT

3.2.9 Morse Road/Buckley Drive Area

The Morse Road/Buckley Drive area is located approximately 1.8 miles southeast of the Saint-Gobain Water Street facility. The area is a mixture of industrial, commercial, and residential development. Limited groundwater samples have been collected in the immediate vicinity of Morse Road in CAAII (this area is connected to public water); however, groundwater samples collected west of Morse Road in CAAI (i.e., along Cardinal Lane and Silk Road) have elevated concentrations of PFOA.

Potential sources of PFAS in the vicinity of the Morse Road/Buckley Drive area include:

- JBM Sherman Carmel (formerly known as JBM Carmel and Spraytech), previously located on Water Street and currently located on Morse Road[1], is a metal fabricator and spray coat painter which reported fluoropolymer pellets in their waste stream when located on Water Street. Their website indicates that they offer Chemical Agent Resistant Coatings.
- K & E Plastics, located on Morse Road, which specializes in plastics fabrication and machining, works with Teflon® and other thermoplastics.
- Timberline Panel Company, a structural insulated panel manufacturer. Potential waste construction materials appear to be stockpiled outside the building in recent aerial photographs. Miller Structures, a modular commercial builder formerly occupied this property. Construction materials and demolition debris are also known sources of PFAS.
- Doxsee Roofing, a roofing contractor. Potential virgin or waste construction materials appear to be stored behind the building in recent aerial photography. Construction materials and demolition debris are also known sources of PFAS.
- Campbell Builders, a construction company with soil stockpiles, potential construction debris, and construction vehicles/equipment stored onsite. Construction materials and demolition debris are also known sources of PFAS.
- Uncle Zippy's Performance, Inc., an auto repair service. Certain car-care products and automotive parts may contain PFAS.
- Martin's Autobody, an auto repair service. Certain car-care products and automotive parts may contain PFAS.
- Guyette Restorations, an auto restoration business. Certain car-care products and automotive parts may contain PFAS.
- The Bennington Iron Works (BIW) and Arken Industries (a machine shop) were also formerly located in the Morse Road Industrial Park. It is unknown if BIW or Arken Industries used/stored PFAS containing materials for their iron-working or machining operations, respectively.

3.2.10 Phyllis Lane/Harwood Hill Road:

The Phyllis Lane/Harwood Hill Road area is located approximately 1.8 miles southeast of the former Chemfab facility. This area is a mixture of commercial and industrial development, located immediately north of the of the Morse Road/Buckley Drive area.

Potential sources of PFAS in the vicinity of the Phyllis Lane/Harwood Hill Road area include:

[1] An EDR obtained for the Water Street area indicated that JBM Carmel was located on Water Street and that a 2010 Vermont Tier II chemical inventory associated with that operation included fluoropolymer pellets. However, the alternative facility names provided as part of the Tier II documentation were listed as ADC Optical Systems and Tyco Electric, which we understand to be separate business entities. Golder was unable to independently confirm JBM Carmel operated at a Water Street location.

DRAFT

- Monument Industries, formerly located on Phyllis Lane, manufactured plastic bags and machined plastic parts (such as fittings and bushings used for electronics).
- Morse Block, Inc., a masonry, concrete, and landscaping materials business located on Harwood Hill Road. PFAS is known to have been used in stone and tile sealants, and as a cement additive (Kissa, 2001).
- Graphitek/i3 Imaging, a printing business located on Harwood Hill Road. PFAS are known to have been used in printing inks to aid in wetting and pigment dispersion.
- Johnson Controls, an automotive battery manufacturer, was formerly located just north of this area off North Bennington Road. Lithium ion batteries are known to contain PFAS. Additionally, Johnson Controls reported that a "mold coat compound" was one of the wastes they disposed of at the Bennington Landfill. Mold-release compounds are known to contain fluoropolymer compounds.
- Reif's R&R and the former B&B Auto Repair, auto repair services. Certain car-care products and automotive parts may contain PFAS.
- Petricca Construction was formerly located on Harwood Hill Road in the northern portion of this area; construction materials used for their operations may have included pre-cast concrete.

Several other businesses are currently or were formerly located in this area, including: L&G Fabricators (welding and steel fabrication), Merrill Transport (a trucking company), and McGill Air Flow (a duct manufacturer). It is unknown whether the operations associated with these business included use or storage of PFAS containing materials.

3.2.11 Kocher Drive/Shields Drive/East Road Area

The Kocher Drive/Shields Drive/East Road area is located approximately 3.0 miles southeast of the former Chemfab facility, and is a predominantly industrial area with few residential and commercial properties. The former Kocher Drive landfill was located in the western portion of this area, and has been redeveloped as a public park.

Potential sources of PFAS in the vicinity of the Kocher Drive/Shields Drive/East Road area include:

- The Kocher Drive Dump, which received industrial wastes from businesses including dyers, electronics manufacturers, battery manufacturers, machine tool companies, and paper and printing companies. In addition, "junk" vehicles were stored at the site. As previously noted, PFAS are known to have been used in printing inks to aid in wetting and pigment dispersion, and some textile treatments are known to contain PFAS. Additionally, lithium ion batteries are known to contain PFAS. Finally, car care products such as automotive waxes, spray wash cleaners, and shampoos for fabrics and vinyl surfaces are known to contain fluorinated surfactants. Vehicles that have been treated with these materials and then stored in an exposed outdoor environment can cause PFAS impacts to soil and/or groundwater. VTDEC has also indicated that PFOA has been detected in monitoring wells at the Kocher Drive Dump.
- Courtaulds Structural Composites, formerly located on Shields Drive, was a manufacturer of composite materials for aerospace, defense, and commercial markets. Teflon® is listed among the waste materials the company disposed of at the Bennington Landfill. Based on publicly available records, Courtaulds Structural Composites later became Vermont Composites (also previously located at Shields Drive), which was later acquired by Kaman Composites (currently located on Kocher Drive).

  Kaman Composites currently maintains an Air Pollution Control Permit relating to the emission of dust from machining equipment, paint/surface coatings from spray booths, composite curing ovens, and solvents from metal cleaning activities.

DRAFT

- Willow Park is located on and adjacent to the Kocher Drive Dump west of East Road, and has multiple sports fields. Biosolids and/or herbicides/pesticides may have been applied on these fields.
- Several auto repair services are located in this area, including: Bennington Auto Tech, Triple J Auto Care, Langway of Bennington, and Morse Repair. Certain car-care products and automotive parts may contain PFAS.
- FW Webb, a wholesale distributor of plumbing fixtures and supplies, including Teflon® tape and fittings.
- Sit 'n' Spin Laundromat; fabric treatments used to impart stain resistant qualities to fabrics are known to contain PFAS.

Several other industrial and/or commercial operations are currently or were formerly located in this area, including: NSK Steering Systems America (automotive components manufacturer), Plasan Carbon Composites (manufacturer of carbon fiber parts), Bijur Lubricating Corporation (former manufacturer of lubrication systems and mist coolant equipment), Abacus Automation (manufacturer of custom automation equipment), and Maple Brook Farm (commercial cheese production facility). It is unknown whether the operations associated with these business included use or storage of PFAS containing materials.

3.3 Potential Sources Summary

Golder focused its evaluation of potential sources in areas where one or more sulfonate compounds were detected in groundwater, or areas where its desktop review suggested industrial and commercial users or storage of PFAS-containing materials. In addition to the potential sources identified in these focus areas, Golder identified numerous other industrial, commercial, and agricultural facilities that may represent PFAS sources in the Corrective Action Areas, as illustrated in Figure 2. The potential sources located outside of the focus areas require additional evaluation of facility history and operational practices. In addition, this evaluation may be updated once the CSM SI is completed.
