

Search Methods

There are two search features; one for Production wells and one for Observation wells (and springs). Each record type has its own tab.

For Production Wells: click on that tab; you can search a general area by **Town**, or more specifically by **WSID, PID, Consultant Well ID**, etc. Add the information you have and then click **Search**. A list box will show the available Production well reports (records). Click **View** to see the specific Production well record. Each record will show the information gathered for that Production Well for the yield testing (Step test, Constant Rate Discharge Test, Recovery, etc.) conducted on during a specific time period. At the bottom of the page, a box will show the individual Observation Wells (well or spring) monitored during that particular test. Click **View** to see each Observation Report separately.

There is a link (in blue) to open a GIS Atlas Map page showing the Production Well location on our ANR Atlas.

At the top right of the page there is a **Tools** button. When not in Edit mode, you can show or hide all of the data field names.

To start a new search, click **Clear** and then enter new information.
