Summary Report

On September 27, 1999 Environmental Products & Services of Vermont, Inc. (EPSVT) responded to a release of #2 fuel oil, which had occurred at an earlier date, located at the Sudbury Town Hall in Sudbury, VT. Please refer to EPSVT clean-up report dated October, 1999 for detailed clean-up activities. EPSVT completed the site clean up and installed a liquid phase activated carbon filtration unit as this was the final phase in clean-up activities.

The carbon system consisted of one 55 gallon drum, containing 165 pounds of granular liquid phase activated carbon, which was plumbed into the Town Hall's sump pump discharge line. The discharge line exits the basement through the South wall and runs 75 yards in a Southwesterly direction, below ground surface, where it discharges into a drainage ditch alongside the Route 30 Northbound lane.

EPSVT inspected the unit twice monthly to verify its operational status and for routine maintenance when necessary. Groundwater sampling was performed monthly and samples were sent to Environmental Laboratory Services in North Syracuse, NY for analysis. EPA method 8100M for total petroleum hydrocarbons (TPH) and EPA Method 8021B for volatile organic compounds (VOC's) were run on both the influent and effluent. Effluent monitoring was performed to ensure that no contaminants were being discharged.

Note: Analyticals indicated petroleum saturation of carbon drum in Feb., 2000. Activated carbon unit was replaced and spent carbon unit transported and disposed of in accordance with local, state and federal guidelines on Vermont Manifest VT0107474, attachment #1.

The carbon filtration unit has been in place for one year to date and influent sample analysis indicated a decline in TPH and VOC's through November of 1999 and plateau below detectable limits in December 1999, Feb. and March 2000.

Note: No sampling results for January 2000. Samples broken during UPS transport to laboratory. Client not billed for this activity.

In April , 2000 I telephoned Mr. Chuck Schwer, Vermont Agency of Natural Resources, and verbally reviewed site history and informed him of three consecutive months of non-detectable TPH results. I was instructed to continue sampling and inspection practices pending the submission and review of my final report. In the interim April's analyticals were received indicated a TPH influent hit of 1 mg/L. Subsequently, I informed Mr. Schwer of this result. We agreed on another month of sampling to verify this result was not an anomaly. May 2000 influent's TPH was 132 mg/L confirming that petroleum was still evident in the groundwater. Routine inspections and sampling procedures have continued to date and all TPH and VOC influent results have been below instrumentation detection limits since. Please refer to Analytical Summary page, attachment #2 for specifics.

Recommendations and Conclusions

The placement of the liquid phase activated carbon filtration unit was the final phase in the clean up of the #2 fuel oil release in September, 1999.

Note: Please refer to EPSVT's spill clean-up report dated October 1999 for a detailed description of clean-up activities.

Influent analysis indicate non-detectable limits for TPH and VOC's from June through October, 2000. Based on this information EPSVT recommends the following:

1. The liquid phase activated carbon filtration unit be decommissioned and the contaminated carbon be transported and disposed in accordance with local, state and federal guidelines.

2. Closure of site activities upon decommissioning of unit as EPSVT believes no further corrective actions are necessary.

If you have any questions or comments, please contact me at (802) 862-1212.

Very truly yours,
